## DEPARTMENT OF PHYSICS

## PG SYLLABUS 2025

---

POSTGRADUATE PROGRAMME {UCC PGP}  
IN PHYSICS

---

# Master of Science in Physics

PROGRAMME STRUCTURE AND SYLLABUS  
2025-26 ADMISSIONS ONWARDS

## PREFACE

We are delighted to present the syllabus for the Postgraduate Program in Physics, thoughtfully designed to address emerging needs across diverse domains of theoretical and experimental physics. This curriculum embodies our dedication to academic rigor, scientific advancement, and the all-round development of postgraduate students in the field of physical science. We extend our heartfelt thanks to the PG Board of Studies in Physics, Mahatma Gandhi University, for the exemplary syllabus they have developed.

Physics is a cornerstone of modern society, fuelling technological progress, supporting sustainable development, and expanding our knowledge of the universe. It underpins breakthroughs in fields such as energy, medicine, and communication, while also offering crucial insights and solutions to global issues like climate change and the efficient use of natural resources. In essence, Physics forms the scientific backbone for advancement in nearly all areas of human endeavour.

This program offers a well-rounded combination of in-depth theoretical knowledge, advanced laboratory skills, and introduction to research opportunities. Students will engage with a diverse array of subjects, including mathematical physics, classical mechanics, quantum mechanics, statistical mechanics, electronics, electrodynamics, nuclear physics computational physics and emerging fields such as nanotechnology, material science. The Postgraduate syllabus includes four elective groups, each comprising three specialized courses. These elective courses are offered during the third and fourth semesters of the program. The practical syllabus in physics has been thoughtfully designed to reflect recent advancements across various domains of physics and technology. The integration of seminars, project work, and experiential learning ensures an engaging and immersive academic journey that equips students for successful careers in research, academia, industry, and other scientific fields.

Postgraduate education goes beyond the acquisition of knowledge—it is about cultivating a mindset of exploration and a lifelong dedication to scientific discovery. We genuinely hope this syllabus equips students with the tools and motivation to contribute significantly to scientific progress and global sustainability.

**Ms.Rakhy Raphael**

Chairperson

PG Board of Studies in Physics

## Board of Studies

Sl.No	Name	Position
01	Ms.Rakhy Raphael, HoD, Assistant Professor, Department of Physics, Union Christian College, Aluva	Chairperson
02	Dr. Alex Mathew, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
03	Dr. Manu Punnen John, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
04	Dr. Reshmi R, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
05	Dr. Pramod Dominic, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
06	Dr. Madhu K, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
07	Dr. Shinoj V K, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
08	Dr. Julie Ann Joseph, Assistant Professor, Department of Physics, Union Christian College, Aluva.	Member
09	Dr. Libu K Alexander, Associate Professor, Department of Physics, Calicut University.	Member
10	Dr. Jayakrishnan R, Professor, Department of Physics, Kerala University.	Member
11	Dr. Sajeev U S, Associate Professor, RIT Pampady, Kottayam	Member
12	Dr. Gopikrishnan G , Associate Professor, Government College, Palakkad	Member
13	Dr Kishore V C, Metrology Engineer – Expert Advanced Mechanical and Optical Systems, Rue des Chasseurs Ardennais, 2 B-4031 Angleur – Belgium	Member

## ACKNOWLEDGEMENT

The Postgraduate Board of Studies in Physics at U.C. College extends heartfelt gratitude to the Principal, the Manager, and the Academic Council of the college for their invaluable guidance and support during the revision of the M.Sc. Physics syllabus.

We also express our sincere appreciation to the members of the PG Board of Studies in Physics of Mahatma Gandhi University, who originally formulated and structured the postgraduate syllabus in 2019. The current version includes certain modifications, thoughtfully incorporated based on suggestions from the Board of Studies of the Department of Physics at U.C. College.

## M. Sc. Degree program

### 1. Aim of the program

M. Sc. Physics forms the final formal training of Physics and hence the program aims at providing an in depth knowledge of Physics to the student. After the successful completion of the program, a student should be capable of pursuing research in theoretical/ experimental physics or related areas. The student is expected to acquire a thorough understanding of the fundamentals of Physics so as to select an academic career in secondary or tertiary level. The program also aims at enhancing the employability of the student. Rigorous training requires phased teaching. With this intention credit and semester system is followed in this program. An M.Sc. student should be capable of doing research at least in the preliminary way. To accomplish this, research oriented project is made part of this curriculum

### 2 Eligibility for admissions

Bachelor's degree in physics with an aggregate minimum of 50%marks

### 3 Medium of instruction and assessment

English

### 4 Faculty under which the degree is awarded

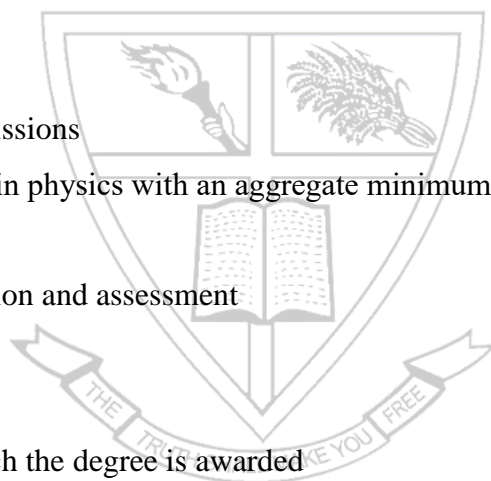

Science

### 5 Specialization offered if any

(1)Electronics,(2) Material science,(3) Informatics (4) Theoretical physics

### 6 Note on compliance with the UGC minimum standards for the conduct and award of postgraduate degrees.

MSc Physics is a two year program in which credit and semester system is followed. An M.Sc. student should be capable of doing research at least in the preliminary way. To accomplish this, research oriented project is made part of this curriculum .There are 18 weeks in a semester and in each week there are 15

lecture hours and 10 laboratory hours. In each semester there are 270 lecture hours and 180 practical hours. Thus the total calendar hours in each semester is 450 which is in compliance with the minimum 390 hours stipulated by the UGC.

## **CHAPTER-I**

### **1. GENERAL SCHEME OF THE SYLLABI**

### 1.1 Theory Courses

There are fifteen theory courses in all four semesters in the M.Sc. Program. Distribution of theory courses is as follows. There are twelve core courses common to all students. Semester I and Semester II will have **four** core courses each and Semester III will have **three** core courses and Semester IV will have **one** core course. **One** elective course is in semester III and **two** elective courses are in semester IV. There are four Elective Bunch offered in this syllabus. An Elective Bunch has three theory courses. A college can choose one Elective Bunch in one academic year.

### 1.2 Practicals

All four semesters will have a course on laboratory practicals. The laboratory practicals of Semesters I, II and IV are common courses. The Semester III laboratory practical course will change, subject to the Elective Bunch opted by the college. A minimum of 12 experiments should be done and recorded in each semester. The practical examinations will be conducted at the respective examination centers by two external examiners appointed by the university at the end of even semesters only. The first and second semester examinations of laboratory practical courses will be conducted at the end of Semester II while the third and fourth semester practical examinations will be conducted at the end of Semester IV.

### 1.3 Project

The project of the PG program should be relevant and innovative in nature. The type of project can be decided by the student and the guide (a faculty of the department or other department/college/university/institution). The project work should be taken up seriously by the student and the guide. The project should be aimed to motivate the inquisitive and research aptitude of the students. The students may be encouraged to present the results of the project in seminars/symposia. The conduct of the project may be started at the beginning of Semester III, with its evaluation scheduled at the end of Semester IV along with the practical examination as being practiced in the present syllabus. The project is evaluated by the external examiners. The project guide or a faculty member deputed by the head of the department may be present at the time of project evaluation. This is to facilitate the proper assessment of the project.

#### **1.4 Viva Voce**

A viva voce examination will be conducted by the two external examiners at the time of evaluation of the project. The components of viva consists of subject of special interest, fundamental physics, topics covering all semesters and awareness of current and advanced topics.

#### **1.5 Course Code**

The 12 core courses in the program are coded according to the following criteria. The first two letters of the code indicates the name of program, ie. PH stands for Physics. The next two digits indicate the stream. The next two digits indicate the semester and the last two digits run for the core courses (Refer Table 1.1)The elective courses are coded as follows. In PH800403, 80 stands for the Elective Bunch A (ELECTRONICS), 04 stands for fourth semester and the digit 03 stands for the 3rd course of the Elective Bunch. (Refer Table 1.2)

Laboratory Practical courses are similarly coded. (Eg: PH0101P means I Semester, General Physics Lab).PH800302 is the Advanced Practicals in Electronics, PH810302 is the Advanced Practicals in Material Science. etc.

#### **1.6 Course Structure of M.Sc. Physics Program**

This is the PG program followed by all affiliated colleges under Mahatma Gandhi University. Apart from this, one affiliated college has a PG programme in Physics with different course structure. This is discussed in Chapter IV. The detailed structure of the Core courses common to all students of the program is given in Table 1.1

**Table 1.1: Structure of MSc Physics under PG-CSS 2019**

Semester	Course Code	Name of the courses	No of hrs / week	Credits
I	PH010101	Mathematical methods in Physics – I	3	3
	PH010102	Classical Mechanics	4	4
	PH010103	Electrodynamics	4	4
	PH010104	Electronics	4	4
	PH010105	General Physics Practicals	10	4
		<b>Total for Semester 1</b>	<b>25</b>	<b>19</b>
II	PH010201	Mathematical methods in Physics – II	4	4
	PH010202	Quantum Mechanics – I	3	4
	PH010203	Statistical Mechanics	4	4
	PH010204	Condensed Matter Physics	4	4
	PH010205	Electronics Practicals	10	4
		<b>Total for Semester 2</b>	<b>25</b>	<b>20</b>
III	PH010301	Quantum Mechanics – II	4	4
	PH010302	Computational Physics	4	4
	PH010303	Atomic and Molecular Physics	4	4
		Elective – 1	3	3
		Advanced Elective Practicals	10	5
		<b>Total for Semester 3</b>	<b>25</b>	<b>20</b>
IV	PH010401	Nuclear and Particle Physics	5	4
		Elective – 2	5	3
		Elective – 3	5	3
	PH010402	Computational Physics Practicals	10	4
	PH010403	Project	-	5
	PH010404	Comprehensive viva voce	-	2
		<b>Total for Semester 4</b>	<b>25</b>	<b>21</b>
		<b>Grand Total</b>		<b>80</b>

### 1.7 The Elective Bunches

There are four Electives Bunches offered in this PGCSS Program. Each elective consists of a bunch of three theory courses and one laboratory course. The first theory course and the laboratory course of a bunch are placed in the Semester III, while the second and third are in Semester IV. An institution can select only one Elective Bunch in an academic year. The course structure of the Electives Bunches is given in Table 1.2

The Electives Bunches are named,

- (i) Bunch A : Electronics
- (ii) Bunch B : Material Science
- (iii) Bunch C : Informatics
- (iv) Bunch D : Theoretical Physics.

**Table 1.2: The Elective Bunch**

#### **Bunch A: Electronics Specialization: Course code 80**

Semester	Course Code	Course Title	No. of hrs / week	Credits
3	PH800301	Digital Signal Processing	3	3
4	PH800402	Micro Electronics and Semi Conductor Devices	5	3
4	PH800403	Communication Systems	5	3
3	PH800302	Advanced Practicals in Electronics	10	5

#### **Bunch B: Materials Science Specialization: Course code 81**

Semester	Course Code	Course Title	No. of hrs / week	Credits
3	PH810301	Solid State Physics for Materials	3	3
4	PH810402	Science of Advanced Materials	5	3
4	PH810403	Nanostructures and Materials Characterisation	5	3
3	PH810302	Advanced Practicals in Materials Science	10	5

**Bunch C: Informatics Specialization: Course code 82**

Semester	Course Code	Course Title	No. of hrs / week	Credits
3	PH820301	Programming in JAVA and HTML	3	3
4	PH820402	Data Communication and Computer Networks	5	3
4	PH820403	Computer applications in Physics	5	3
3	PH820302	Practicals in Informatics	10	5

**Bunch D: Theoretical Physics: Course code 83**

Semester	Course Code	Course Title	No. of hrs / week	Credits
3	PH830301	General Relativity and Applications	3	3
4	PH830402	Nonlinear Dynamics	5	3
4	PH830403	Quantum Field Theory	5	3
3	PH830302	Special Computational Practicals	10	5

**1.8 Distribution of Credit**

The total credit for the program is fixed at 80. The distribution of credit points in each semester and allocation of the number of credit for theory courses, practicals, project and viva is shown in Table 1.1 and Table 1.2.

## **CHAPTER - II**

### **2. GRADING AND EVALUATION**

## 2.1 Examinations

The evaluation of each course shall contain two parts such as Internal or In-Semester Assessment (IA) and External or End-Semester Assessment (EA). The ratio between internal and external examinations shall be 1:3.

Evaluation (Both internal and external) to be done by the teacher is based on a six point scale as shown in the table below

Grade	Grade Points
A+	5
A	4
B	3
C	2
D	1
E	0

Direct Grading System based on a 7 – point scale is used to evaluate the performance of students in both External and Internal Examinations.

For all courses (theory & practical) / semester/overall program letter grades and **GPA/SGPA/CGPA** are given in the following table 2.1:

Range	Grade	Indicator
4.50 to 5.00	A+	Outstanding
4.00 to 4.49	A	Excellent
3.50 to 3.99	B+	Very good
3.00 to 3.49	B	Good(Average)
2.50 to 2.99	C+	Fair
2.00 to 2.49	C	Marginal
up to 1.99	D	Deficient(Fail)

## 2.2 Internal or In-Semester Assessment (IA)

Internal evaluation is to be done by continuous assessments of the following components. The components of the internal evaluation for theory and practicals and their weights are as in the Table 2.2 and Table 2.3. The components of the internal evaluation for project and comprehensive viva-voce and their weights are as in the Table 2.4 and Table 2.5. The internal assessment should be fair and transparent. The evaluation of the components should be published and acknowledged by students. All documents of internal assessments are to be kept in the institution for 2 years and shall be made available for verification by the university. The responsibility of evaluating the internal assessment is vested on the teacher(s) who teach the course. The two test papers should be in the same model as the end semester examination question paper, the model of which is discussed in the Section 2.3. The duration and the number of questions in the paper may be adjusted judiciously by the college for the sake of convenience.

**There shall be no separate minimum grade point for internal evaluation of Theory, Practical, Project, and Comprehensive viva-voce.** No separate minimum is required for Internal evaluation for a pass, but a minimum **C** grade is required for a pass in an external evaluation. However, a minimum **C grade** is required for pass in a course.

### 2.2.1 Attendance ,Assignment and seminar

Attendance is not a component for the internal evaluation. But students with attendance less than 75% in a course are not eligible to attend external examination of that course. The performance of students in the seminar and assignment should also be documented.

### 2.2.2 Project Evaluation

The internal evaluation of the project is done by the supervising guide of the department or the member of the faculty decided by the head of the department. The project work may be started at the beginning of the Semester III. The supervising guide should keenly and sincerely observe the performance of the student during the course of project work. The supervising guide is expected to inculcate in student(s), the research aptitude and aspiration to learn and aim high in the realm of research and

development. A maximum of three students may be allowed to perform one project work if the volume of the work demands it. Project evaluation begins with (i) the selection of problem, (ii) literature survey, (iii) work plan, (iv) experimental / theoretical setup/data collection, (v) characterization techniques/computation/analysis (vi) use of modern software for data analysis/experiments (Origin, LAB View, MATLAB, ...etc) and (vi) preparation of dissertation. The project internal grades are to be submitted at the end of Semester IV. The internal evaluation is to be done as per the following general criteria given in Table 2.4

The internal evaluation of comprehensive viva-voce is to be done as per the following general criteria given in Table 2.5

**Table 2.2 Theory-Internal**

**For Theory(Internal)- Components and Weightage**

	<b>Components</b>	<b>Weightage</b>
i.	Assignment	1
ii	Seminar	2
iv	Best Two Test papers	1 each (2)
	<b>Total</b>	<b>5</b>

	<b>Total</b>	<b>5</b>

<b>Components</b>	<b>Weightage</b>
Subject of special interest, fundamental physics, topics covering all semesters and awareness of current and advanced topics.	5
<b>Total</b>	<b>5</b>

**Table 2.5 Comprehensive Viva- Internal**

**Comprehensive viva (Internal)- Components and Weightage**

**2.2.3 General Instructions**

- The assignments/ seminars / test papers are to be conducted at regular intervals. These should be marked and promptly returned to the students.
- One teacher appointed by the Head of the Department will act as a coordinator for consolidating grade sheet for internal evaluation in the department in the format supplied by the University. The consolidated grade sheets are to be published in the department notice board, one week before the closing of the classes for end semester examinations. The grade sheet should be signed by the coordinator and counter signed by the Head of the Department and the college Principal.
- The consolidated grades in specific format supplied by the university are to be kept in the college for future references. The consolidated grades in each course

directed by the University.

- iv. A candidate who fails to register for the examination in a particular semester is not eligible to continue in the subsequent semester.
- v. Grievance Redress Mechanism for Internal evaluation: There will be provision for grievance redress at four levels, viz,
  - a. at the level of teacher concerned,
  - b. at the level of departmental committee consisting of Head of the Department, Coordinator and teacher concerned,
  - c. at the level of college committee consisting of the Principal, Head of the Department and one member of the college council, nominated by the principal each year,
  - d. at the university level committee consisting of Pro-Vice Chancellor /Dean of the Faculty, the controller of examinations and the Convener of the Standing Committee on Academic Affairs of the Syndicate.

College level complaints should be filed within one week of the publication of results and decisions taken within the next two weeks. University level complaints will be made within the time stipulated by the University and decisions will be taken within one month of the last date fixed for filing complaints.

### **2.3 External Evaluation (EA)**

The external examination of all semesters shall be conducted by the university on the close of each semester. There will be no supplementary examinations.

#### **2.3.1 Question Paper Pattern for Theory Courses.**

All the theory question papers are of three hour duration. All question papers will have three parts. The question shall be prepared in such a way that the answers can be awarded **A+,A,B,C,D,E**.

**Part A:** Questions from this part are very short answer type. Eight questions have to be answered from among ten questions. Each question will have weight one and the Part A will have a total weight of eight. A minimum of two questions must be asked from each unit of the course.

**Part B:** Part B consists of problem solving and short essay type questions from the course concerned. Six questions out of eight given have to be answered. Each question has a weight two making the Part B to have total weight twelve. Minimum of three problems should be asked in Part B.

**Part C:** Part C will have four questions. One question from each unit must be asked. Each question will have a weight five making the total weight ten in Part C.

Maximum weight for external evaluation is **30**. Therefore Maximum Weighted Grade Point (WGP) is **150**

### 2.3.2 Directions for question setters

Different types of questions shall be given different weights to quantify their range as shown below:

	Type of Questions	Weight	Number of questions to be answered
Part A	Short Answer type questions	1	8 out of 10
Part B	Short essay/ problem solving type questions	2	6 out of 8
Part C.	Long Essay type questions	5	2 out of 4

### 2.3.3 Practical, Project and Viva Voce Examinations

First and second semester practical examinations are conducted at the end of Semester II and third and fourth semester practical examinations are conducted at the end of Semester IV. The practical examinations are conducted immediately after the second and fourth semester theory examinations respectively. There will be two practical examination boards even' year to conduct these practical exams. All practical examinations will be of five hours duration. Two examiners from the panel of examiners of the university will be deputed by the board chairman to each of the examination centers for the fair and transparent conduct of examinations. Practical examination is conducted in batches having a maximum of eight students. The board enjoys the right to decide on the components of practical and the respective weights.

**Project Evaluation:** The project is evaluated by the two external examiners deputed from the board of practical examination. The dissertation of the project is examined long with the oral presentation of the project by the candidate. The examiners should

ascertain that the project and report are genuine. Innovative projects or the results/findings of the project presented in national seminars may be given maximum advantage. The supervising guide or the faculty appointed by the head of the department may be allowed to be present at the time of project evaluation. This is only to facilitate proper evaluation of the project. The different weight for assessment of different components is shown in Table 2.5.

**Table 2.5 Project- External**  
**For Project(External) Components and Weightage**

Components	Weightage
Relevance of the topic and analysis	3
Project content and presentation	7
Project viva	5
<b>Total</b>	<b>15</b>

**Comprehensive Viva- Voce Examination:** Viva voce examination is conducted only by the two external examiners of the board of practical examinations. The viva voce examination is given a credit two. The examination should be conducted in the following format shown in Table 2.6 below.

**Table2.6 Comprehensive viva-voce(External)-components and weightage**

Components	Weightage
Subject of special interest, fundamental physics, topics covering all semesters and awareness of current and advanced topics.	15
<b>Total</b>	<b>15</b>

Both project evaluation and viva voce examination are to be conducted in batches of students formed for the practical examinations.

**Reappearance/Improvement:** For reappearance/ improvement as per university rules, students can appear along with the next regular batch of students of their particular semester. A maximum of two chances will be given for each failed paper. Only those papers in which candidate have failed need be repeated. Chances of reappearance will be available only during eight continuous semesters starting with the semester in which admission/readmission is given to the candidate.

**2. Evaluation Second stage**– Calculation of Grade Point Average (**GPA**) of a course (to be done by the University)

**3. Evaluation Third stage** -Semester Grade Point Average (**SGPA**) (to be done by the University)

**4. Evaluation- Fourth stage** - Cumulative Grade Point Average(**CGPA**) (to be done by the University)

## CHAPTER III

### 1. M. Sc. PHYSICS SYLLABUS

#### 1.1 INTRODUCTION

This chapter deals with the syllabi of all core courses, Elective courses of the MSc.

Physics program. The semester wise distribution of the courses is given.

In the semester III and semester IV, the courses from elective bunch will come as opted by the colleges concerned.

#### 1.2 CORE COURSES

##### SEMESTER I

##### PH010101: MATHEMATICAL METHODS IN PHYSICS – I

Total Credits: 3

Total Hours: 54

Objective of the course: The objective of this course is to make students have an idea of vector, matrices and tensors, it's physical interpretation and applications.

#### UNIT I

##### Vector analysis (8 hrs)

1.1 Line, Surface and Volume integrals 1.2 Gradient, divergence and curl of vector Functions 1.3 Gauss Divergence Theorem 1.4 Stoke's Theorem 1.5 Green's Theorem 1.6 Potential Theory 1.6.1 Scalar Potential-Gravitational Potential, Centrifugal Potential

##### Curvilinear co-ordinates (8 hrs)

1.7 Transformation of co-ordinates 1.8 Orthogonal Curvilinear co-ordinates 1.9 Unit Vectors in curvilinear systems 1.10 Arc Length and Volume Elements 1.11 Gradient, Divergence and Curl in orthogonal curvilinear co-ordinates 1.12 Special Orthogonal co-ordinates system 1.12.1 Rectangular Cartesian Co-ordinates 1.12.2 Cylindrical Co-ordinates 1.12.3 Spherical Polar Co-ordinates

#### UNIT II

##### Linear vector space (8 hrs)

1.1 Definition of linear vector space 2.2 Inner product of vectors 2.3 basis sets 2.4 Gram schmidt ortho normalization 2.5 Expansion of an arbitrary vector 2.6 Schwarz inequality

### **Probability theory and distribution (6 hrs)**

2.7 Elementary Probability Theory 2.8 Binomial Distribution 2.9 Poisson Distribution  
2.10 Gaussian Distribution 2.11 Central Limit Theorem

### **UNIT III**

#### **Matrices(12hrs)**

3.1 Normal, Orthogonal, Unitary and Hermitian Matrices 3.2 Pauli spin matrices 3.3 Cayley Hamilton Theorem 3.4 Similarity transformation, Orthogonal transformations, Unitary Transformations 3.5 Eigenvalues, Eigenvectors 3.6 Diagonalization of matrices 3.7 Functions of matrices 3.8 Direct sum and Direct product of matrices

### **UNIT IV**

#### **Tensors (12 hrs)**

4.1 Definition of Tensors 4.2 Basic Properties of Tensors 4.3 Covariant, Contravariant & Mixed Tensors 4.4 Kronecker delta, Levi-Civita Tensor 4.5 Metric Tensor and its properties 4.6 Tensor algebra 4.7 Associated Tensors 4.8 Christoffel Symbols & their transformation laws 4.9 Covariant Differentiation 4.10 Geodesics

#### **Recommended Text Books:**

1. Mathematical methods for Physicists, G.B. Arfken & H.J. Weber 5<sup>th</sup> edition, Academic Press.
2. Mathematical Physics , V. Balakrishnan, Ane Books Pvt Limited
3. Introduction to Mathematical Physics – Charles Harper, PHI
4. Vector Analysis & Tensor Analysis – Schaum's Outline Series, M. R. Spiegel, McGraw Hill
5. Mathematical methods for physics and engineering, K F Riley, M P Hobson, S J Bence, Cambridge University press.

#### **Recommended References:**

1. An Introduction to Relativity, Jayant V. Narliker, Cambridge University Press.
2. Advanced Engineering Mathematics E. Kreyszig 7<sup>th</sup> edition John Wiley
3. Mathematical Physics, B. S. Rajput, Y. Prakash 9<sup>th</sup> edition Pragati Prakashan
4. Mathematical Physics, B. D. Gupta ,Vikas Publishing House
5. Matrices and tensors in Physics, A. W. Joshi
6. Mathematical Physics , P. K. Chatopadhyay ,New Age International Publishers
7. Mathematical Physics, Sathyaprakash, Sultan Chand & Sons

## PH010102: CLASSICAL MECHANICS

Total Credits: 4

Total Hours: 72

Objective of the course:

After completing the course, the students will (i) understand the fundamental concepts of the Lagrangian and the Hamiltonian methods and will be able to apply them to various problems; (ii) understand the physics of small oscillations and the concepts of canonical transformations and Poisson brackets; (iii) understand the basic ideas of central forces and rigid body dynamics; (iv) understand the Hamilton-Jacobi method and the concept of action-angle variables. This course aims to give a brief introduction to the Lagrangian formulation of relativistic mechanics.

### UNIT I

#### **Lagrangian formulation (14 hrs)**

1.1 Review of Newtonian Mechanics: Mechanics of a Particle; Mechanics of a System of Particles; Constraints; 1.2 D' Alembert's principle and Lagrange's equations; velocity-Dependent potentials and the Dissipation Function; Lagrangian for a charged particle in electromagnetic field; 1.3 Application of Lagrange's equation to: motion of a single particle in Cartesian coordinate system and plane polar coordinate system; bead sliding on a rotating wire. 1.4 Hamilton's Principle; Technique of Calculus of variations, 1.5 Derivation of Lagrange's equations from Hamilton's Principle. 1.6 Canonical momentum; cyclic coordinates.

#### **Hamiltonian formulation: (4hrs)**

1.7 Legendre Transformations; Hamilton's canonical equations of motion; Hamiltonian for a charged particle in electromagnetic field. 1.8 Cyclic coordinates and conservation theorems; Hamilton's equations of motion from modified Hamilton's principle

### UNIT II

#### **Small oscillations (8hrs)**

2.1 Stable equilibrium unstable equilibrium and neutral equilibrium; motion of a system near stable equilibrium- Lagrangian of the system and equations of motion.

2.2 Small oscillations- frequencies of free vibrations; normal coordinates and normal

modes. 2.3 free vibrations of CO<sub>2</sub> molecule- resonant frequencies normal modes and normal coordinates.

### **Canonical transformations and poisson brackets (10 hrs)**

2.4 Equations of canonical transformations; Four basic types of generating functions and the corresponding basic canonical transformations. Examples of canonical transformations - identity transformation and point transformation. 2.5 Solution of harmonic oscillator using canonical transformations.

2. 6 Poisson Brackets ; Fundamental Poisson Brackets; Properties of Poisson Brackets

2.7 Equations of motion in Poisson Bracket form; Poisson Bracket and integrals of motion; Poisson's theorem; Canonical invariance of the Poisson bracket.

### **UNIT III**

#### **Central force problem (9hours)**

3.1 Reduction of two-body problem to one-body problem; Equation of motion for conservative central forces - angular momentum and energy as first integrals; law of equal areas 3.2 Equivalent one-dimensional problem –centrifugal potential; classification of orbits. 3.3 Differential Equations for the orbit; equation of the orbit using the energy method; The Kepler Problem of the inverse square law force Scattering in a central force field - Scattering in a Coulomb field and Rutherford scattering cross section.

#### **Rigid body dynamics (9hrs)**

3.4 Independent coordinates of a rigid body; Orthogonal transformations; Euler Angles. 3.5 Infinitesimal rotations: polar and axial vectors; rate of change of vectors in space and body frames; Coriolis effect. 3.6 Angular momentum and kinetic energy of motion about a point; Inertia tensor and the Moment of Inertia; Eigenvalues of the inertia tensor and the Principal axis transformation. 3.7 Euler equations of motion; force free motion of a symmetrical top.

### **UNIT IV**

#### **Hamilton-Jacobi theory and action-angle variables(12 hrs)**

4.1 Hamilton-Jacobi Equation for Hamilton's Principal Function; physical significance of the principal function. 4.2 Harmonic oscillator problem using the Hamilton-Jacobi method. 4.3 Hamilton-Jacobi Equation for Hamilton's characteristic function. 4.4 Action-Angle variables; harmonic oscillator problem in action-angle variables.

### **Classical mechanics of relativity ( 6 hrs.)**

4.5 Lorentz transformation in matrix form; velocity addition; Lorentz transformation in three dimensions. 4.6 Lagrangian formulation of relativistic mechanics.

### **Recommended Text Books**

1. Classical Mechanics: Herbert Goldstein , Charles Poole and John Safko, (3/e); Pearson Education.
2. Classical Mechanics: G. Aruldas, Prentice Hall 2009.

### **Recommended References:**

### **PH010103: ELECTRODYNAMICS**

Total credits: 4

Total hours: 72

**Objective of the course:** Electromagnetic force is one of the four forces that exist in nature with a prominent role in the daily activities of human being. So it is necessary to know the physics of this force from the basics of two inter twinned phenomena called electricity and magnetism. Hence the course aims to impart proper understanding of electricity magnetism and electrodynamics; wave nature of electromagnetic field and its properties; electromagnetic field radiating out of accelerated charges and the impact of relativity in electromagnetism along with confined propagation of electromagnetic wave.

## UNIT I

### Electrostatics, Magnetostatics and basics of Electrodynamics (18 hrs)

1.1 Electrostatics: Electric field of a polarized object- Electric field in a - conductor-dielectric - electric displacement -Gauss's law in dielectric medium-linear dielectric medium-. Boundary condition across dielectric ( $\epsilon_{r1}$ )-dielectric ( $\epsilon_{r2}$ ), conductor-dielectric ( $\epsilon_r$ ), conductor-free space ( $\epsilon_r=1$ ) interface. 1.2 Uniqueness theorem and electrostatic potential-Solving Laplace equations for boundary value problems 1.3 Method of images- point charge -line charge above a grounded conducting plane. 1.4 Potential at large distance-multipole expansion due to localized charge distribution – Electric field of a dipole. 1.5 Magnetic field inside matter- Magnetization (M)- Magnetic flux density (B)-Auxiliary field (H). 1.6 Electrodynamics: Faraday's law-, electrodynamic equations - displacement current. 1.7 Uniform sinusoidal time varying fields E and B and Maxwell's equations in free space and matter. Boundary conditions of electric and magnetic field 1.8 Conservation laws- continuity equation- Poynting's theorem-Maxwell's stress tensor- momentum conservation.

## UNIT II

### Electromagnetic waves (18 hrs)

2.1 Wave equation for E and B- monochromatic plane waves- energy- momentum 2.2 Propagation of em waves through linear media- Reflection and transmission of a plane wave at normal - oblique incidence. 2.3 Electromagnetic waves in a conducting medium. Reflection at conducting surface- frequency dependence of permittivity 2.4 Dispersion of electromagnetic waves in non-conductors,. 2.5 Guided waves - Waveguides. Waves between parallel planes-TE-TM-TEM waves . Rectangular waveguide- TE-TM waves -impossibility of TEM wave.

## UNIT III

### Electromagnetic radiation (18 hrs)

3.1 Potential formulation of electrodynamics- Gauge transformations-Coulomb and Lorentz gauge  
3.2 Continuous charge distribution-Retarded potential-Jefmenko's equation.

3.3 Point charges- Lienard-Wiechert potentials-Field of a point charge in motion-  
Power radiated by a point charge

3.4 Electric dipole radiation-magnetic dipole radiation-3.5 Radiation reaction-  
Abraham-Lorentz formula.

## **UNIT IV**

### **Relativistic electrodynamics and Waveguides (18 Hrs)**

4.1 Relativistic electrodynamics

4.2 Structure of spacetime- Four vectors-Proper time and proper velocity- Relativistic energy and momentum-Relativistic dynamics- Minkowski force.

4.3 Magnetism as a relativistic phenomenon.

4.4 Lorentz transformation of em field- field tensor-electrodynamics in tensor notation.

4.5 Potential formulation of relativistic electrodynamics.

#### **Recommended textbooks:**

1. Introduction to Electrodynamics, David J. Griffiths, PHI.
2. Electromagnetics, John D.Kraus, McGraw-Hill International
3. Classical electrodynamics, J.D Jackson, John Wiley & Sons Inc

#### **Recommended References:**

1. Electromagnetic waves and radiating systems Edward C Jordan, Keith G Balmain, Printice Hall India Pvt.Ltd
2. Elements of Electromagnetic, Mathew N. O Sadiku, Oxford University Press
3. Antenna and wave propagation, K.D Prasad, Satyaprakashan, New Delhi
4. Electromagnetism problems with solutions, Ashutosh Pramanik, PHI.

## **PH010104: ELECTRONICS**

Total credits: 4

Total hours: 72

Objective of the course: Electronics is the study of the flow of charge (electron)

through various materials and devices such as semiconductors, resistors, inductors, capacitors, nanostructures etc. All applications of electronics involve the transmission of power and possibly information.

## **UNIT I**

### **Op-amp with Negative Feedback (16 Hrs)**

1.1. Differential amplifier – Inverting amplifier – Non-inverting amplifier -Block diagram representations – Voltage series feedback: Negative feedback – closed loop voltage gain 1.2. Difference input voltage ideally zero – Input and output resistance with feedback – Bandwidth with feedback – Total output offset voltage with feedback– Voltage follower. 1.3 Voltage Shunt Feedback Amplifier: Closed-loop voltage gain; Inverting input terminal and virtual ground; Input and output resistance with feedback; Bandwidth enhancement with feedback; Total output offset voltage with feedback. 1.4. Current to voltage converter- Inverter. Differential amplifier with one op-amp and two op-amps.

## **UNIT II**

### **The Practical Op-amp (6 Hrs)**

2.1. Input offset voltage –Input bias current – input offset current – Total output offset voltage- Thermal drift.2.2. Effect of variation in power supply voltage on offset voltage – Change in input offset voltage and input offset current with time - Noise – Common mode configuration and CMRR.

### **General Linear Applications (with design) (14Hrs)**

2.3. DC and AC amplifiers – AC amplifier with single supply voltage – Peaking amplifier – Summing, Scaling, averaging amplifiers.2.4. Instrumentation amplifier using transducer bridge. Differential input and differential output amplifier – Low voltage DC and AC voltmeter. 2.5. Voltage to current converter with grounded load – Current to voltage converter. 2.6. Very high input impedance circuit – integrator and differentiator.

## **UNIT III**

### **Frequency Response of an Op-amp (6 Hrs)**

3.1. Frequency response –Compensating networks – Frequency response of internally compensated and non-compensated op-amps – High frequency op- amp equivalent

circuit.3.2. Open loop gain as a function of frequency – Closed loop frequency response – Circuit stability - slew rate.

### **Active Filters and Oscillators (with design) (12Hrs)**

3.3. Active filters – First order and second order low pass Butterworth filter 3.4 First order and second order high pass Butterworth filter.3.5. Wide and narrow band pass filter - wide and narrow band reject filter. All pass filters – Oscillators: Phase shift and Wien-bridge oscillators. 3.6. Square, triangular and sawtooth wave generators-Voltage controlled oscillator.

## **UNIT IV**

### **Comparators and Converters (6 Hrs)**

4.1. Basic comparator- Zero crossing detector.4.2. Schmitt Trigger – Comparator characteristics- Limitations of op-amp as comparators. 4.3. Digital-to-Analog (D/A) converters - binary weighted resistors and R-2R ladder network; Analog-to-Digital (A/D) converters- successive approximation method. Peak detector – Sample and Hold circuit.

### **IC555 Timer (5 Hrs)**

4.5.IC 555: Internal architecture, Applications: Monostable multivibrator, Astable multivibrator, IC 565: Internal architecture; Application as Phase-Locked Loop (PLL). Voltage regulator ICs 78XX and 79XX.

### **Analog Communication (7 Hrs)**

4.6. Types of modulation: Amplitude Modulation, Frequency Modulation, Phase Modulation, Amplitude Modulation (AM) - Definition and mathematical representation, 4.7. Detection (demodulation), Automatic Gain Control, AM demodulation - Envelope Detector, Synchronous detector, FM Detection - slope detector, Foster-Seeley Discriminator and ratio detector, 4.8. Radio receivers – Tuned radio frequency receivers (Principle and block diagram), Superhetrodyne receiver (Principle and block diagram).

### **Recommended Text Books:**

1. Op-amps and linear integrated circuits R.A. Gayakwad 4<sup>th</sup>Edn.PHI
2. Electronic Communication Systems, Kennedy& Davis 4<sup>th</sup>Ed.TMH,

### **Recommended References:**

1. Electronic Devices (Electron Flow Version), 9/E Thomas L. Floyd, Pearson
2. Fundamentals of Electronic Devices and Circuits 5<sup>th</sup> Ed. David A. Bell, Cambridge.

### **PH010105:GENERAL PHYSICS PRACTICALS**

Total credits: 4

Total hours: 180

*\* Minimum number of experiments to be done 12*

*\* \*\*Error analysis of the result is a compulsory part of experimental work*

1. Hall Effect in Semiconductor. Determine the Hall coefficient, carrier concentration and carrier mobility.
2. Ultrasonic- acoustic optic technique-elastic property of a liquid.
3. Magnetic susceptibility of a paramagnetic solution using Quinck's tube method.
4. Curie temperature of a magnetic material.
5. Dielectric Constant and Curie temperature of ferroelectric Ceramics.
6. Draw the hysteresis curve (B – H Curve) of a ferromagnetic material and determination of retentivity and coercivity.
7. Cornu's method- Determination of elastic constant of a transparent material
8. Determination of  $e/m$  by Thomson's method.
9. Determination of  $e/k$  of Silicon.
10. Determination of Planck's constant (Photoelectric effect).
11. Measurement of resistivity of a semiconductor by four-probe method at different temperature and determination of band gap.
12. Determination of magnetic susceptibility of a solid by Guoy's method.
13. Measurement of wavelength of laser using reflection grating.
14. Fraunhofer diffraction pattern of a single slit, determination of wavelength/slit width.
15. Fraunhofer diffraction pattern of wire mesh, determination of wavelength/slit width.

16. Fraunhofer diffraction pattern of double slit, determination of wavelength/slit width.
17. Diffraction pattern of light with circular aperture using Diode/He-Ne laser.
18. Fresnel diffraction pattern of a single slit. Study the beam divergence, spot size and intensity profile of Diode/He-Ne laser.
19. Determine the numerical aperture of optical fibre and propagation of light through it.
20. Determine the refractive index of the material using Brewster angle setup.
21. Absorption bands of  $\text{KMnO}_4$  using incandescent lamp. Determine the wave lengths of the absorption bands. Determine the wave lengths of the absorption bands by evaluating Hartman's constants.
22. Determine the co-efficient of viscosity of the given liquid by oscillating disc method.
23. Measure the thermoemf of a thermocouple as function of temperature. Also prove that Seebeck effect is reversible.
24. Determine the Young's modulus of the material of a bar by flexural vibrations.
25. Using Michelson interferometer determine the wavelength of light.
26. Study the temperature dependence of dielectric constant of a ceramic capacitor and verify Curie-Weiss law
27. Study the dipole moment of an organic molecule (acetone).
28. Determine the dielectric constant of a non-polar liquid.
29. Photograph/Record the absorption spectrum of iodine vapour and a standard spectrum. Analyze the given absorption spectrum of iodine vapour and determine the convergence limit. Also estimate the dissociation energy of iodine (wave number corresponding to the electronic energy gap =  $759800 \text{ m}^{-1}$ )
30. Determine the dielectric constant of a non-polar liquid.
31. Determine the charge of an electron using Millikan oil drop experiment.
32. Linear electro optic effect (Pockel effect), Frank Hertz experiment.
33. Frank Hertz experiment determination of ionization potential.
34. Koenig's method, Poisson's ratio of the given material of bar.

35. Determination of Stefan's constant of radiation from a hot body.

## SEMESTER II

### PH010201: MATHEMATICAL METHODS IN PHYSICS – II

Total Credits: 4

Total Hours: 72

Objective of the course: Introduce the concepts of Laplace and Fourier transforms. Introduce the Fourier series and its application to solutions of partial differential equations.

#### UNIT I

##### Complex analysis (18 hrs)

1.1 Functions of a complex variable 1.2 Analytic functions 1.3 Cauchy-Riemann equation 1.4 Integration in a complex plane 1.5 Cauchy Theorem 1.6 Cauchy's integral formulas 1.7 Taylor expansion & Laurent expansion 1.8 Residue, poles 1.9 Cauchy residue theorem 1.10 Cauchy's principle value theorem 1.11 Evaluation of integrals

#### UNIT II

##### Integral transforms (18 hrs)

2.1 Fourier Series 2.2 Application of Fourier series 2.2.1 Square Wave 2.2.2 Full Wave Rectifier 2.3 Fourier Integral 2.4 Fourier Transform 2.4.1 Finite Wave Train 2.5 Convolution Theorem of Parseval's relation 2.6 Momentum representation 2.6.1 Hydrogen atom 2.6.2 Harmonic oscillator 2.7 Laplace Transform, Inverse Laplace transform 2.8 Damped Oscillator. 2.9 LCR circuit.

#### UNIT III

##### Special functions and differential equations (18 hrs)

3.1 Gamma Function 3.2 Beta Function 3.3 Symmetry Property of Functions 3.4 Evaluation of Beta functions 3.5 Other forms of Beta Functions --Transformation of P Functions 3.6 Evaluation of Gamma Functions 3.7 Other forms of Gamma Functions--Transformation of Gamma Functions 3.8 Relation between Beta and Gamma Functions 3.9 Evaluation of Integrals. 3.10 Legendre Differential Equation 3.11 Hermite Differential Equations.

#### UNIT IV

##### Partial differential equations (18 hrs)

4.1 Characteristics of boundary conditions for partial differential equation 4.2 Solution of partial differential equations by the method of separation of variables in Cartesian, cylindrical and spherical polar co-ordinates 4.3 Solution of Laplace equation in cartesian, cylindrical and spherical polar co-ordinates. 4.4 Non-Homogeneous equation 4.5 Green's function 4.6 Symmetry of Green's Function 4.7 Green's Function for Poisson Equation, Laplace equation.

**Recommended Text Books:-**

1. Mathematical methods for Physicists, G.B. Arfken & H.J. Weber 5<sup>th</sup> edition, Academic Press.

**Recommended Reference Books:**

2. Mathematical Physics, B. S. Rajput, Y. Prakash 9<sup>th</sup> edition Pragati Prakashan
3. Mathematical Physics, B. D. Gupta, Vikas Publishing House
4. Matrices and tensors in Physics, A. W. Joshi
5. Mathematical Physics, P. K. Chatopadhyay, New Age International Publishers
6. Mathematical Physics, Sathyaprakash, Sultan Chand & Sons

**PH010202 QUANTUM MECHANICS-I**

Total Credits: 4

Total Hours: 54

Objective of the course:

This course aims to develop the basic structure of quantum Mechanics. After completing the course, the student will (i) understand the fundamental concepts of the Dirac formalism (ii) understand how quantum systems evolve in time; (iii) understand the basics of the quantum theory of angular momentum. Also, this course enable the student to solve the hydrogen atom problem which is a prelude to more complicated problems in quantum mechanics.

**UNIT I**

**Basics Formulation of Quantum Mechanics (20 hours)**

1.1 Development of the idea of state vectors from sequential Stern-Gerlach

PROGRAM STRUCTURE & SYLLABUS M. Sc PHYSICS Page No

experiments ;Dirac notation for state vectors: ket space, bra space and inner products;  
1.2 Operators; Associative axiom; outer product; 1.3 Hermitian adjoint; Hermitian operator; Eigenkets and eigenvalues of Hermitian operators. Eigenkets of observables as base kets; concept of complete set. Projection operators. 1.4 Matrix representations of operators, kets and bras 1.5 Measurements in quantum mechanics; expectation value ; Compatible observables and existence of simultaneous eigenkets; General Uncertainty Relation. 1.6 Unitary operator, change of basis and transformation matrix, unitary equivalent observables. 1.7 Position eigenkets, infinitesimal translation operator and its properties, linear momentum as generator of translation, canonical commutation relations. Wavefunction as an expansion coefficient; eigenfunctions, momentum eigen function 1.8 momentum space wavefunctions and the relation between wavefunctions in position space and momentum space. Gaussian wave packet- computation of dispersions in position and momentum.

## UNIT II

### Quantum Dynamics (16 hours)

2.1 Time evolution operator and its properties 2.2 Schrodinger equation for the time evolution operator; solution of the Schrodinger equation for different time dependences of the Hamiltonian 2.3 Energy eigenkets; time dependence of expectation values 2.4 time evolution of a spin half system and spin precession 2.5 Correlation amplitude; time-energy uncertainty relation and its interpretation. Schrodinger picture and Heisenberg picture; behavior of state kets and observables in Schrodinger and Heisenberg pictures; Heisenberg's equation of motion. Ehrenfest's theorem; time evolution of base kets; transition amplitudes. 2.8 Simple Harmonic Oscillator: Energy eigenvalues and energy eigenkets.

## UNIT III

### Theory of Angular Momentum (14 hours)

3.1 Non-commutativity of rotations around different axes; the rotation operator; fundamental commutation relations for angular momentum operators 3.2 rotation operators for spin half systems; spin precession in a magnetic field 3.3 Pauli's two component formalism; 2X2 matrix representation of the rotation operator 3.4 ladder operators; eigenvalue problem for angular momentum operators 3.5 matrix  
PROGRAM STRUCTURE & SYLLABUS M. Sc PHYSICS Page No

representation of angular momentum operators.3.6 Orbital angular momentum ; orbital angular momentum as a generator of rotation3.7 Addition of orbital angular momentum and spin angular momentum; addition of angular momenta of two spin-1/2 particles. General theory of Angular Momentum addition-Computation of Clebsch - Gordon coefficients.

## UNIT IV

### The Hydrogen Atom (4 hours)

4.1 Orbital angular momentum 4.2 spherical harmonics 4.3 Coulomb potential and hydrogen atom 4.4 radial wave function for hydrogen atom 4.5 Degeneracy in hydrogen atom

### Recommended Text Books:

1. Modern Quantum Mechanics : J. J. Sakurai, Pearson Education.

## PH010203 STATISTICAL MECHANICS

Total Credits: 4

Total Hours: 72

### UNIT I (20 hrs)

1.1. The Statistical Basis of Thermodynamics 1.1.1. Macroscopic and microscopic states.1.1.2.Connection between thermodynamics and statistics.1.1.3.Classical ideal gas.1.1.4.Entropy of mixing and Gibbs paradox.1.1.5. Correct enumeration of micro states.1.2. Elements of Ensemble Theory 1.2.1. Phase space of a classical system. 1.2.2. Liouville's theorem.1.2.3. Micro-canonical ensemble.1.2.4. Quantum states and phase space.

### UNIT II (18 hrs)

1.3. Canonical ensemble.1.3.1. Equilibrium between a system and a heat reservoir.1.3.2. System in canonical ensemble.1.3.3. Physical significance of statistical quantities in canonical ensemble.1.3.4. Classical systems.1.3.5. Energy fluctuations in canonical ensemble.1.3.6.Equipartition theorem.

2.1. Grand canonical Ensemble 2.1.1. Equilibrium between system and energy-particle reservoir.2.1.2.A system in grand canonical ensemble.2.1.3.Physical significance of various statistical quantities.2.1.4. Examples.2.1.5. Fluctuations in grand canonical ensemble.

### UNIT III(20hrs)

2.2. Formulation of Quantum Statistics 2.2.1.Quantum mechanical ensemble theory. 2.2.2.Density matrix.2.2.3.Statistics of various ensembles.2.2.4.Examples (an electron in magnetic fields, free particle in a box). A system composed of indistinguishable particles.

3.1. Quantum Theory of Simple Gases 3.1.1. Ideal gas in quantum-micro canonical ensemble.3.1.2.Ideal gas in other quantum mechanical ensembles.3.1.3.Statistics of the occupation numbers 3.2.Ideal Bose Systems 3.2.1.Thermodynamic behaviour of ideal Bose gas. .3.3. Ideal Fermi Systems 3.3.1.Thermodynamics of ideal Fermi gas.

### UNIT IV(14 hrs)

4.1. Phase Transitions 4.1.1. Phases.4.1.2. Thermodynamic potentials, 4.1.3. Approximation.4.1.4. First order phase transition.4.1.5. Clapeyron equation. 4.3

Continuous Phase transition- Ising model, order parameter. 4.4 Landau theory 4.5 Symmetry breaking

**Recommended Text books:**

1. Text book- R.K. Pathria, Statistical Mechanics, second edition (1996), Butterworth, Heinemann. (For Modules I, II and III.)
2. R Bowley and M. Sanchez, Introductory Statistical Mechanics, second edition, Oxford University Press. (For Module IV )

**Recommended Reference Books:**

1. Kerson Huang, Statistical Mechanics, John Wiley and Sons (2003).
2. F. Rief, Fundamentals of Statistical and Thermal Physics, McGraw Hill (1986).
3. D. Chandler, Introduction to Statistical Mechanics, Oxford University Press (1987)
4. L.D Landau and E.M Lifshitz, Statistical Physics (Vol-1), 3<sup>rd</sup> Edition. Pergamon Press(1989)
5. Yung-Kuo Lim, Problems and Solutions in Thermodynamics and Statistical Mechanics, World Scientific (1990).

**PH010204: CONDENSED MATTER PHYSICS**

Total Credits: 4

Total Hours: 72

**UNIT I**

**Wave Diffraction and the Reciprocal Lattice (5Hrs)**

**1.1** Diffraction of waves by crystals-Bragg's Law- **1.2** Scattered wave amplitude-reciprocal lattice vectors- diffraction condition-Laue equations-Ewald construction- **1.3** Brillouin zones- reciprocal lattice to SC, BCC and FCC lattices-properties of reciprocal lattice- **1.4** diffraction intensity - structure factor and atomic form factor- physical significance.

**Crystal Symmetry (7Hrs)**

**1.5** Crystal symmetry-symmetry elements in crystals-point groups, space groups

**1.6** Ordered phases of matter-translational and orientational order- kinds of liquid crystalline order-Elements of Quasi crystals

## **Free Electron Fermi Gas (12 Hrs)**

**1.7.** Energy levels in one dimension-quantum states and degeneracy- density of states-

**1.8** Fermi-Dirac statistics -Effect of temperature on Fermi-Dirac distribution –**1.9** Free electron gas in three dimensions- **1.10** Electronic specific heat - relaxation time and mean free path - **1.11** Electrical conductivity and Ohm's law - Widemann- Franz- Lorentz law - electrical resistivity of metals.

## **UNIT II**

### **Energy Bands (8 Hrs)**

**2.1** Nearly free electron model- Origin of energy gap-Magnitude of the Energy Gap-

**2.2** Bloch functions – **2.3** Kronig-Penney model –**2.4** Wave equation of electron in a periodic potential **2.5.** Brillouin zone- construction of Brillouin zone in one and two dimensions – extended, reduced and periodic zone scheme of Brillouin zone (qualitative idea only) - **2.6** Effective mass of electron –**2.7** Distinction between conductors, semiconductors and insulators.

### **Semiconductor Crystals (10 Hrs)**

**2.8.** Band Gap-**2.9.**Equations of motion-Effective mass-Physical interpretation of effective mass - Effective mass in semiconductors-Silicon and Germanium-**2.10** Intrinsic carrier concentration- **2.11** Impurity conductivity-Thermal ionization of Donors and Acceptors-Thermoelectric effects-semimetals-super lattices-Bloch Oscillator-Zener tunnelling.

## **UNIT III**

### **Phonons**

#### **Crystal Vibrations and Thermal Properties (16 Hrs)**

**3.1**Vibrations of crystals with monatomic basis –First Brillouin zone-Group Velocity-

**3.2** Two atoms per Primitive Basis – **3.3** Quantization of elastic waves –**3.4** Phonon momentum-**3.5** Inelastic scattering of phonons.-**3.6** Phonon Heat Capacity-Plank distribution-Density of States in one and three dimensions-Debye model for density of states-Debye  $T^3$  Law-Einstein Model for Density of states- **3.7** Anharmonic Crystal interactions-Thermal Expansion- **3.8** Thermal Conductivity-thermal resistivity of

phonon gas-Umklapp Processes-Imperfections

## UNIT IV

### Magnetic Properties of Solids (14 hrs)

4.1 Quantum theory of paramagnetism–Hund's rules-crystal field splitting-spectroscopic splitting factor-4.2 Cooling by adiabatic demagnetization 4.3 Ferromagnetic order- weiss theory of ferromagnetism, Temperature dependence of the spontaneous magnetization, 4.4. quantum theory of ferromagnetism, Ferromagnetic domains, 4.5. Domain model-Corecivity and Hysteresis; 4.6. Domain theory. 4.7. Antiferromagnetic order-susceptibility below Neel- Temperature-4.8 Ferrimagnetism and ferrites, 4.9. Magnons, neutron magnetic scattering, Single Domain Particles 4.10. Geomagnetism and Biomagnetism-Magnetic force microscopy.

## PH010205:ELECTRONICS PRACTICAL

Total credit: 4

Total hours: 180

*\* Minimum number of experiments to be done 12*

*\*\*Error analysis of the result is a compulsory part of experimental work*

*\*\*\* PC interfacing facilities such as ExpEYES can be used for the experiments*

1. Op-Amp parameters (i) Open loop gain (ii) input offset voltage (iii) input bias current (iv) CMRR (v) slew rate (vi) Band width
2. Design and construct an integrator using Op-Amp ( $\mu A741$ ), draw the input output curve and study the frequency response.
3. Design and construct a differentiator using Op-Amp ( $\mu A741$ ) for *sin wave and square wave input* and study the output wave for different frequencies.
4. Design and construct a logarithmic amplifier using Op-Amp ( $\mu A741$ ) and study the output wave form.
5. Design and construct a square wave generator using Op-Amp ( $\mu A741$ ) for a frequency  $f_0$ .
6. Design and construct a triangular wave generator using ( $\mu A741$ ) for a frequency  $f_0$ .
7. Design and construct a saw tooth wave generator using Op-Amp ( $\mu A741$ ) generator.
8. Design and construct an Op-Amp Wien bridge oscillator with amplitude stabilization and study the output wave form.
9. Design and construct a Schmidt trigger using Op-Amp  $\mu A741$ , *plot of the hysteresis curve.*
10. Design and construct an astable multivibrator using  $\mu A741$  with *duty cycle other than 50%*
11. Design and construct a RC phase shift oscillator using  $\mu A741$  for a frequency  $f_0$ .
12. Design and construct a first and second order low pass Butterworth filter using  $\mu A741$  and *plot the frequency response curve.*
13. Design and construct a first and second order high pass Butterworth filter using  $\mu A741$  and *study the frequency response.*

14. Design and construct a first order narrow band pass Butterworth filter using  $\mu A741$ .
15. Solving differential equation using  $\mu A741$
16. Design and construct current to voltage and voltage to current converter ( $\mu A741$ )
17. Astable multivibrator using 555 timer, study the positive and negative pulse width and free running frequency.
18. Monostable multivibrator using 555 timers and study the input output waveform.
19. Voltage controlled Oscillator using 555 timer
20. Design and construct a Schmitt Trigger circuit using IC 555.
21. Design and test a two stage RC coupled common emitter transistor amplifier and find the bandwidth, mid-frequency gain, input and output impedance.
22. Design and test a RC phase shift oscillator using transistor for a given operating frequency.
23. Voltage controlled Oscillator using transistor Study the function of (i) analog to digital converter using IC 0800 (ii) digital to analog converter DAC 0808
24. Study the application of op-Amp ( $\mu A741$ ) as a differential amplifier.
25. Solving simultaneous equation using op-Amp ( $\mu A741$ ).

**SEMESTER III**  
**PH010301: QUANTUM MECHANICS-II**

Total Credits: 4

Total Hours: 72

Objective of the course:

This course aims to extend the concepts developed in the course ' Quantum Mechanics-I . After completing this course, the student will (i) understand the different stationary state approximation methods and be able to apply them to various quantum systems; (ii) understand the basics of time-dependent perturbation theory and its application to semi-classical theory of atom-radiation interaction; (iii) understand the theory of identical particles and its application to helium; (iv) understand the idea of Born approximation and the method of partial waves. Also, this course will introduce the student to the basic concepts of relativistic quantum mechanics.

**UNIT I**

**Approximation Methods for Stationary States(18 hrs)**

1.1 Non-degenerate Perturbation Theory: First order energy shift; first order correction to the energy eigenstate; second order energy shift. Harmonic oscillator subjected to a constant electric field. 1.2 Degenerate Perturbation theory First order Stark effect in hydrogen; Zeeman effect in hydrogen and the Lande g-factor.

1.3 The variational Method; Estimation of ground state energies of harmonic oscillator and delta function potential.

1.4 The WKB method and its validity; The WKB wavefunction in the classical region; non-classical region.

**UNIT II**

**Time-Dependent Perturbation Theory (18 hrs)**

2.1 Time dependent potentials; interaction picture; time evolution operator in interaction picture; Spin Magnetic Resonance in spin half systems 2.2 Time dependent perturbation theory; Dyson series; transition probability 2.3 constant perturbation; Fermi's Golden Rule ; Harmonic perturbation. 2.4 Energy shift and decay width.

## UNIT III

### Identical Particles and Scattering Theory (18hrs)

3.1 Bosons and fermions; anti-symmetric wave functions and Pauli's exclusion principle. 3.2 The Asymptotic wave function - differential scattering cross section and scattering amplitude 3.3 The Born approximation- scattering amplitude in Born approximation; validity of the Born approximation; Yukawa potential ; Coulomb potential and the Rutherford formula. 3.4 Partial wave analysis- hard sphere scattering; S-wave scattering for finite potential well; Resonances and Ramsauer-Townsend effect .

## UNIT IV

### Advanced topics in Quantum Mechanics(18 hrs)

4.1 The EPR paradox 4.2 Bell inequalities 4.3 Entanglement, 4.4 Entanglement and teleportation 4.5 Density Operator : Pure and Mixed states, Entanglement entropy.

#### Relativistic quantum mechanics:

4.6 Klein-Gordon Equation; continuity equation and probability density in Klein-Gordon theory.

4.7 Dirac Equation in the Schrodinger form; Dirac's matrices and their properties

#### **Recommended Text Books:**

1. Modern Quantum Mechanics: J. J. Sakurai, Pearson Education.
2. A modern Approach to Quantum Mechanics: John Townsend, Viva Books New Delhi
3. Introduction to Quantum Mechanics: D.J. Griffith, Pearson Education
4. Relativistic Quantum Mechanics: Walter Greiner, Springer-Verlag

### **PH010302: COMPUTATIONAL PHYSICS**

Total Credits:4

Total Hours: 72

Objective of the Course:

To help the students to have the basic idea about the techniques used in physics to solve problems with the help of computers when they cannot be solved analytically with pencil and paper since the underlying physical system is very complex. After the completion of this course students might be able to develop their own Algorithms of every method described in the syllabus.

#### **UNIT I**

##### **Curve Fitting and Interpolation (20Hrs)**

1.1 The least squares method for fitting a straight line, 1.2 The least squares method for fitting a parabola, 1.3 The least squares method for fitting a power curves, 1.4 The least squares method for fitting an exponential curves. 1.5 Interpolation - Introduction to finite difference operators, 1.6 Newton's forward and backward difference interpolation formula, 1.7 Newton's divided difference formula, 1.8 Cubic spline interpolation.

## UNIT II

### Numerical Differentiation and Integration(16 Hrs)

2.1 Numerical differentiation, 2.2 errors in numerical differentiation, 2.3 Integration of a function with Trapezoidal Rule, 2.4 Integration of a functions with Simpson's  $\frac{1}{3}$  and  $\frac{3}{8}$  Rule and error associated with each. 2.6 Relevant Algorithms for each.

## UNIT III

### Numerical Solution of Ordinary Differential Equations (20Hrs)

3.1 Euler method, 3.2 modified Euler method, 3.3 Runge- Kutta 2nd Order 3.4 Runge - Kutta 4<sup>th</sup> order methods, 3.5 Higher order equations. 3.6 Concepts of stability.

### Numerical Solution of System of Equations

3.7 Gauss elimination Method, 3.8 Gauss-Jordan elimination Method, 3.9 Gauss-Jordan method to find inverse of a matrix. 3.10 Power method.

## UNIT IV

### Numerical solutions of partial differential equations (16Hrs)

4.1 Elementary ideas and basic concepts in finite difference method, 4.2 Schmidt Method, 4.3 Crank - Nicholson method, 4.4 Monte Carlo evaluation of integrals, 4.5 Buffon's needle problem, 4.6 requirement for random number generation.

### Recommended Text Books:

1. Numerical Methods for Scientists and Engineers , K SankaraRao, PHI Pvt. Ltd .
2. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd.
3. Explorations in Monte Carlo Methods Ronald W Shonkwiler and Franklin Mendivil , Springer

### Recommended Reference Books:

2. Numerical methods for scientific and Engineering computation M.K Jain, S.R. Kiyengar, R.K. Jain, New Age International Publishers
3. Computer Oriented Numerical Methods, V. Rajaraman, PHI, 2004.
4. Numerical Methods, E. Balagurusami, Tata McGraw Hill, 2009.

5. Numerical Mathematical Analysis, J.B. Scarborough, 4PthP Edn, 1958

### **PH010303: ATOMIC AND MOLECULAR PHYSICS**

Total Credits: 4

Total Hours: 72

Objective of the course:

This course is intended to develop the basic philosophy of spectroscopy. Its aims to equip the student with the understanding of (1) atomic structure and spectra of typical one- electron and two-electron systems. (2) the theory of microwave and infra-red spectroscopies as well as the electronic spectroscopy of molecules; (3) the basics of Raman spectroscopy and the nonlinear Raman effects; (4) the spin resonance spectroscopies such as NMR and ESR. This course also introduces the student to the ideas of Mossbauer spectroscopy.

#### **UNIT I**

##### **Atomic Spectra (18 Hrs)**

1.1 Vector atom model and quantum numbers - 1.2 - spectroscopic terms - Hund's rule, Derivation of spin-orbit interaction energy in one electron system; g- factor, fine structure in sodium atom, Selection rules, Lande g-formula. 1.3 Normal Zeeman effect; Anomalous Zeeman effect. 1.4 Paschen-Back effect – splitting of sodium D-lines; Stark effect in one electron system. 1.5. Coupling schemes - L S coupling scheme- spectroscopic terms arising from two valence electrons; derivation of interaction energy, terms arising from two equivalent s-electrons - sp and pd electrons, Lande interval rule, 1.6 The jj coupling scheme in two electron systems - Derivation of interaction energy; Hyperfine structure and width of spectral lines (qualitative ideas only).

#### **UNIT II**

##### **Microwave and Infra Red Spectroscopy (18 Hrs)**

2.2 Width of spectral lines-natural width, collision broadening, Doppler broadening. Classification of molecules- linear, symmetric top, asymmetric top and spherical top molecules. 2.2 Rotational spectra of rigid diatomic molecules; effect of isotopic substitution; intensity of spectral lines; energy levels and spectrum of non-rigid rotor

2.3 Information derived from rotational spectra( molecular structure, dipole moment , atomic mass and nuclear quadrupole moment).2.4Vibrational energy of a diatomic molecule- simple harmonic oscillator –energy levels; diatomic molecule as anharmonic oscillator- energy levels; infrared selection rules; spectrum of a vibrating diatomic molecule. 2.5 Diatomic vibrating rotator –P and R branches; break down of Born-Oppenheimer approximation. 2.6 Vibrations of polyatomic molecules – fundamental vibrations and their symmetry; overtone and combination frequencies; Analysis by IR techniques- skeletal vibrations and group frequencies.

### **UNIT III**

#### **Raman Spectroscopy and Electronic Spectroscopy. (18 Hrs)**

3.1Quantum theory of Raman effect; classical theory-molecular polarizability ;Pure rotational Raman spectra of linear molecules 3.2 Raman activity of vibrations; rule of mutual exclusion; vibrational Raman spectra ;rotational fine structure 3.3 Structure determination from Raman and IR spectroscopy. 3.4Surface Enhanced Raman Spectroscopy (SERS)-surfaces for SERS, Enhancement mechanism,Applications of SERS 3.5 Electronic spectra of diatomic molecules –Born- Oppenheimer approximation, vibrational coarse structure-progressions and sequences; intensity of spectral lines- Franck – Condon principle 3.6 Dissociation energy and dissociation products; Rotational fine structure of electronic-vibrational transition ; Fortrat parabola; Predissociation.

### **UNIT IV**

#### **Spin Resonance Spectroscopy (18 Hrs)**

4.1 Nuclear Magnetic Resonance (NMR)-resonance condition ; 4.2 Chemical shift ; indirect spin–spin interaction 4.3 CW NMR spectrometer; Magnetic Resonance Imaging.4.4 Electron Spin Resonance(ESR)- Principle of ESR; ESR spectrometer; characteristics of the g-factor. 4.5 Total Hamiltonian for an electron; Hyperfine Structure- ESR spectrum of hydrogen atom. 4.6 Mossbauer effect - recoilless emission and absorption; Experimental techniques in Mossbauer spectroscopy 4.7 Isomer shift; quadrupole interaction ;

**Recommended Text Books:**

## SEMESTER IV

### PH010401 NUCLEAR AND PARTICLE PHYSICS

Total Credits: 4

Total Hours: 90

Weightage:

Objective of the course:

This course aims to provide the student to build up the fundamentals of nuclear and particle physics. After undergoing this course, the student will have a knowledge about (1) the basic properties of the nucleus and the nuclear forces. (2) Major models of the nucleus and the theory behind the nuclear decay process; (3) the physics of nuclear reactions (4) the interaction between elementary particles and the conservation laws in particle physics. This course intends to impart some idea about nuclear astrophysics and the practical applications of nuclear physics.

#### Unit I

##### **Nuclear Properties and Nuclear models (18 Hrs)**

1.1 The nuclear radius- distribution of nuclear charge (isotope shift, muonic shift, mirror nuclei); distribution of nuclear matter. Mass and abundance of nuclides, nuclear binding energy.

1.2 Nuclear angular momentum and parity ; Nuclear electromagnetic moments- quadrupole moment. 1.3 The deuteron-binding energy, spin, parity, magnetic moment and electric quadrupole moment.

1.4 Liquid drop model, Bethe–Weizacker formula, Applications of semi- empirical binding energy formula. 1.5 Shell Model-Shell model potential, Spin-orbit potential, Magnetic dipole moments, Electric quadrupole moments, Valence Nucleons 1.6 Collective structure- Nuclear vibrations, Nuclear rotations.

#### Unit II

##### **Nuclear Models and Nuclear Decay (18 Hrs)**

2.1 Alpha decay 2.2 Alpha decay processes 2.3 Systematics 2.4 Theory of alpha emission 2.5 Beta decay- energy release in beta decay ; Fermi theory of beta decay 2.6 Angular momentum and parity selection rules- allowed and forbidden transitions.

Comparative half lives and forbidden decays; non-conservation of parity in beta decay

2.7 Gamma decay- angular momentum and parity selection rules ; internal conversion.

### **Unit III**

#### **Nuclear Reactions (18Hrs)**

3.1 Types of reactions and conservation laws, energetics of nuclear reactions, isospin.

3.2 Reaction cross sections, Coulomb scattering- Rutherford formula, nuclear scattering. 3.3 Scattering and reaction cross sections in terms of partial wave amplitudes. 3.4 Compound-nucleus reactions; Direct reactions. 3.5 Resonance Reactions.

### **Unit IV**

#### **Nuclear forces and Yukawa theory (18 Hrs)**

4.1 Nucleon-nucleon scattering; proton-proton and neutron-neutron interactions 4.2 Properties of nuclear forces 4.3 Exchange force model. 4.4 Yukawa's hypothesis; properties of pi mesons- electric charge, isospin, mass, spin and parity. 4.5 Decay modes and production of pi-mesons 4.6 Types of interactions between elementary particles, Hadrons and leptons

### **Unit V**

#### **Particle Physics and Practical Applications of Nuclear Physics(18 Hrs.)**

5.1 Symmetries and conservation laws, C P and CPT invariance, applications of symmetry arguments to particle reactions, parity non-conservation in weak interactions. 5.2 Quark model, confined quarks, coloured quarks and gluons, experimental evidences for quark model, quark-gluon interaction, quark dynamics. 5.3 Grand unified theories, standard model of particle physics. 5.4 Rutherford Backscattering spectroscopy and applications 5.5 Computerized Axial Tomography (CAT) 5.6 Positron Emission Tomography (PET)

#### **Recommended Text Books:**

1. Introductory Nuclear Physics, K. S. Krane JohnWiley
2. Nuclear Physics, S.N. Ghoshal, S. Chand & Company.
3. Nuclear Physics: Problem-based Approach Including MATLAB, Hari M Agarwal, PHI Learning Private Limited, Delhi .

### Note

## PH010402 COMPUTATIONAL PHYSICS PRACTICALS

- Develop algorithm / Flowchart for all experiments
- Codes can be developed in any package / programming language. Candidate should be trained to explain parts of the codes used.
- Plotting can be done in any plotting package and can be separate from the programming package / environment.
- Verify numerical results with analytical results wherever possible.
- Repeat experiments for various initial values / functions / step-sizes.
- Training may be given to use methods discussed below to solve real physics problems.

Introduction to computational facility in the Centre

Introduction to the IDE used in the center and commands for execution of a program. Inputting data and variables, outputting results on a console. Achieving arithmetic operations and use of data and variables in the software used at the Centre. Usage of decisions and loops. Creating an array and using array operations. Method of declaring functions and function calling. Writing data to a file and reading data from a file. Getting a graph from a data available using plotting software available with the Centre. Find the root of the given non-linear equations by the bisection method

1. Find the root of the given non-linear equations by the Newton-Raphson method
2. A thermistor gives following set of values. Calculate the temperature corresponding to the given resistance using Lagrange interpolation.

Temperature	1101.0 K	911.3 K	636.0 K	451.1 K	273 K
Resistance	25.113 $\Omega$	30.131 $\Omega$	40.120 $\Omega$	50.128 $\Omega$	?

(This is only a sample data. Students should be capable to interpolate any set of data)

3. Newton's forward interpolation / backward interpolation.
4. Using appropriate technique and the given "Table", Calculate the pressure at the temperature asked.

### Steam Table

Temperature in C	140	150	160	170	180
Pressure kgf/cc	3.685	4.854	6.302	8.076	10.22

Temperature: 1750 C (This is only a sample data. Students should be capable to

handle another set of data from any other physical phenomena)

5. Value of some trigonometric function [say  $f(\theta) = \tan(\theta)$ ] for  $\theta=15,30,45,60,75$  are given to you. Using appropriate interpolation technique calculate value of  $f(\theta)$  for a given value.
6. Numerical integration by the trapezoidal rule.
7. Using the trapezoidal rule, calculate the inner surface area of a parabolic reflecting mirror. (length of semi major axis , semi minor axis and height are to be given)
8. Numerical integration by the Simpson rule (both  $1/3$  and  $3/8$  rule).
9. Fit a straight line using method of least square to a set of given data without using any built in function of curve fitting. Compare your result with any built in curve fitting technique.
10. Find out the normal equations and hence fit a parabola using method of least square to a set of given data without using any built in function of curve fitting. Compare your result with any built in curve fitting technique.
11. Fit a exponential curve to the given set of data using method of least square without using any built in curve fitting technique. Compare your result with any built in curve fitting technique.
12. Study the given function as a sum of infinite series. Compare your value with the available standard value.
13. Numerical solution of ordinary first-order differential equations using the Euler methods or the fourth order Runge-Kutta method.
14. Using technique of Monte Carlo method obtain the value of  $\pi$  correct to two decimal places .
15. Using Monte Carlo technique calculate the value of the given integral. Compare your result with result obtained by analytical method.
16. Write a program to solve the given system of linear equations by the Gauss elimination method.
17. Find out inverse of a given matrix by using Gauss-Jordan method.
18. Numerical solution of second-order differential equations using the fourth order Runge-Kutta method.
19. Fast Fourier Transform of a given signal.
20. Solution of Heat equation / Diffusion equation using Finite Difference Method.

21. A Duffing oscillator is given by  $\ddot{x} + \delta \dot{z} + \beta x + \alpha^3 = \gamma \cos \omega t$  where  $\delta$  is damping constant  $> 0$ . Write a program to study periodic and aperiodic behavior
22. Study of path of a Projectile in motion with and without air drag and compare the values.
23. A study of Variation of magnetic field  $B(T)$  with critical temperature in superconductivity
24. Generation of output waveform of a Half wave / full wave rectifier.
25. Charging /discharging of a capacitor through an inductor and resistor
26. Variation in phase relation between applied voltage and current of a series L.C.R circuit
27. Phase plot of a pendulum (driven and damped pendulum)
28. Study variation of intensity along a screen due to the interference from Young's double slit experiment. Also study the variation of intensity with variation of distance of the screen from the slit.
29. Study variation of intensity along a screen due to the diffraction due to a grating. Also study the variation of intensity with variation of distance of the screen from the grating.
30. A particle obeying F-D statistics is constrained to be in 0 to 2eV at 300K. Calculate Fermi energy of this particle assuming  $kT = 0.025\text{eV}$  at 300K
31. Solve the following differential equation and study periodic and aperiodic behavior
 
$$\frac{dy}{dx} = \sigma(y - x), \quad \frac{ddy}{dx} = x(\rho - z) - y, \quad \frac{ddy}{dx} = xy - \beta$$

32. Study the difference equation  $X_{n+1} = mX_n (1 - X_n)$  and obtain periodic and aperiodic behavior.
33. Generate a standing wave pattern and study change in pattern by changing its various parameters.

### Reference books

1. Computational Physics: An Introduction, R.C. Verma, P.K. Ahluwalia & K.C. Sharma, New Age India, Pvt. Ltd, 2014.
2. An Introduction To Computational Physics, 2nd Edn, Tao Pang Cambridge University Press, 2010
3. Numerical Recipes: The Art of Scientific Computing 3rd Edn, William H. Press Cambridge University Press, 2007.

### ELECTIVES BUNCH-A: ELECTRONICS PH800301: DIGITAL SIGNAL PROCESSING

Total Credits: 3

Total Hours: 54

Objective of the Course: To study about **discrete** time systems and to learn about FFT algorithms. To study the design techniques for FIR and IIR digital filters.

### UNIT I

#### Discrete time signals and Linear systems (16 Hours)

1.1 Examples of Signals -1.2 Classification of signals -1.3 System-1.4 Examples of discrete time 1.5 System models 1.5-Signal processing-1.6 Advantages ,Limitations and applications of DSP- 1.7 Elementary continuous time signals-1.8 Representation of discrete time signals-1.9 Elementary discrete time signals-1.10 Classification of discrete time signals-1.11 Operation on signals-1.12 Sampling and Aliasing -1.13 Discrete time system-Classifications-1.14 Representation of an arbitrary sequence- 1.15 Impulse response and convolution sum-properties-Causality-1.15 FIR,IIR, stable and unstable systems-1.16 Correlation of two sequences.

## **UNIT II**

### **DSP Techniques (10 Hrs)**

2.1 Frequency analysis of Discrete Time signals – 2.2 Discrete frequency spectrum and frequency range -2.3 Development of DFT from DTFT – 2.4 Definition of Discrete Fourier transform-2.5 Frequency spectrum using DFT- 2.6 Properties of Discrete Fourier transform-2.7 Relationship of the DFT to other transforms-Properties- 2.8 Fast Fourier Transform (FFT) – 2.9 Decimation in time algorithm – Radix- 2 FFT - 8 point DFT using Radix -2 DIT FFT

## **UNIT III**

### **Z Transform (12 Hrs)**

3.1 Z-Transform & ROC -properties -3.2 Z transform of finite duration ,infinite duration and two sided sequence – 3.3 System function – 3.4 Poles and Zeros- Stability criterion 3.5 (Problems based on determination of Z transform, ROC and Properties are expected)

## **UNIT IV**

### **Digital Filters (16 Hrs)**

4.1 IIR filters-frequency selective filters-4.2 Design of digital filters from Analog filters-4.3 Analog low pass filter design-4.4 Design of IIR filters from Analog filters-4.5 Approximation of derivatives -4.6 Design of IIR filter using impulse invariance Technique-4.7 Bilinear transformation-4.8 Direct form I structure of IIR systems-4.9 Cascade form realization of IIR systems-4.10 Realization of digital filters-4.11 Direct form I realization-4.12 Direct form II realization-4.13 FIR filters-4.14 Linear phase FIR filters-4.15 Design of FIR filter using rectangular window-4.16 The Fourier series method of designing FIR filters

8. Digital Signal Processing and Applications - Dag Stranneby&William Walker

**PH800402: MICROELECTRONICS AND SEMICONDUCTOR DEVICES**

Credits: 3

Number of hours: 90

Objective:

The objective of the course is to expose the students to the architecture and instruction set of basic microprocessors. This course also covers fundamentals of semiconductor devices and their processing steps in detail. The student will be able to use the knowledge of semiconductor fabrication processes to work in industry in the area of semiconductor devices.

**UNIT I**

**Introduction to microprocessors (20Hrs)**

1.1 Microprocessor organization- General organization of a microprocessor based microcomputer system  
 1.2 Memory organization – main memory array –memory management, cache memory, virtual memory  
 1.3 Input/output operation - Standard I/O – memory mapped I/O- interrupt driven I/O –DMA  
 1.4 8085 Microprocessor –

Architecture1.5 8085 addressing modes, instruction set, Pin out diagram,1.6 Simple programming concepts.

## **UNIT II**

### **8086 Microprocessor (16Hrs)**

2.1 The Intel 8086- Architecture - MN/MX modes –Pin diagram 2.2 8086 addressing modes 2.3 8086 instruction set- instruction format- assembler directives and operators 2.4.Programming with 8086- Familiarisation with Debug utility2.5. Interfacing memory and I/O ports.

## **UNIT III**

### **Microcontrollers (19 Hrs)**

3.1 Introduction to microcontrollers and embedded systems 3.2 Comparison of microprocessors and microcontrollers 3.3 The 8051 architecture - Register set of 8051 – important operational features 3.4 I/O pins of 8051, ports and circuits - external memory - counters and timers – interrupts 3.5 Instruction set of 8051 - Basic programming concepts 3.6 Applications of microcontrollers - (basic ideas) – Embedded systems(basic ideas)

## **UNIT IV**

### **Metal-semiconductor and semiconductor hetero-junctions(17Hrs)**

4.1 Metal-semiconductor - Schottky barrier diode - qualitative characteristics – ideal junction properties- 4.2 Current voltage relationship, Comparison with junction diode 4.3 Metal semiconductor ohmic contact 4.4 Idealcon rectifying barriers – tunneling barrier – specific contact resistances 4.5 Semiconductor hetero-junctions – hetero-junction materials – energy band diagram –Two dimensional electron gas 4.6equilibrium electrostatics – current voltage characteristics.

## **UNIT V**

### **Integrated Circuit Fabrication and Characteristics (18 Hrs)**

5.1 Integrated circuit technology – basic monolithic IC – epitaxial growth –marking and etching 5.2 diffusion of impurities – transistor for monolithic circuit 5.3.Monolithic diodes – integrated resistors, capacitors and inductors5.4 monolithic circuit layout - additional isolation methods -MSI, LSI, VLSI– the metal

semiconductor contact.

**Recommended Text books:**

1. Microprocessor Architecture Programming and Applications with 8085, R.S. Gaonkar – Penram int. Pub. Mumbai
2. Fundamentals of Microprocessors and microcomputers- B. Ram (DhanpatRaiPub.)
3. Microprocessors and Microcomputer based system design, H. Rafiquizzaman, Universal Book stall, New Delhi
4. The 8051 microcontroller, Architecture Programming and Applications, Kenneth J Ayala- Penram Int. Pub. Mumbai
5. Semiconductor Physics and Devices, Donald A. Neamen, McGraw Hill
6. Integrated Electronics-Analogue and Digital Circuits and Systems, J Millmann and C C Halkias, TMGH

**Recommended References:**

1. 0000 to 8085 Introduction to Microprocessors for Engineers and Scientists.- P.K. Gosh & P.R. Sridhar, PHI
2. Advanced microprocessors and peripherals, A.K. Ray & K.M. Burchandi –TMH  
Microprocessor and microcontroller, R. Theagarajan- SCITECH Publications India Pvt. Ltd.
3. Microprocessor and Peripherals, S.P. Chowdhury & S. Chowdhury- SCITECH Publications.
4. Operating system Principles, Abraham Silberschatz & Peter Baer Galvin & Greg Gagne, John Wiley
5. Solid state electronic devices, Streetman and Banerjee, PHI (2010).
6. Physics of Semiconductor Devices, Michael Shur, PHI (2002).
7. Introduction to Semiconductor materials and Devices, M.S. Tyagi, John Wiley and Sons (2000)

## **PH800403: COMMUNICATION SYSTEMS**

Total Credits: 3

Total Hours: 90

Objective of the Course: To understand the basic concepts of different communication systems.

### **UNIT 1**

#### **Digital Communication(18 hrs)**

1.1 Pulse Communication -Introduction - Pulse modulation :- PAM - PWM – PPM- PCM 1.2 PCM:- Sampling theorem- Quantisation -Noise Generation and demodulation of PCM- Companding - DPCM- ADPCM-Delta modulation 1.3 Information theory-Coding-Noise-Data Communication – Digital codes – Error detection and correction 1.4 Data sets and interconnection requirements-Modem classification and interfacing 1.5 Multiplexing techniques -Frequency division multiplex -Time division multiplex 1.6 Digital transmission techniques:-ASK- FSK- PSK-QPSK.

### **UNIT II**

#### **Mobile communication(20 hrs)**

2.1 Introduction to Wireless Communication Systems-Mobile Radio System Around the World- Examples of wireless communication systems: - Paging system-Cordless Telephone System- Cellular Telephone System—How a Cellular Telephone Call is Made- Comparison of Common Mobile Radio Systems- Trends in Cellular and Personal Communications 2.2 Wireless communication systems—2G-3G - 4G 2.3 The Cellular Concept-Frequency Reuse-Channel Assignment Strategies-Handoff Strategies:—Prioritizing handoffs and practical handoff consideration-Interference and System Capacity-Improving Coverage and Capacity in Cellular Systems:—Cell splitting- Sectoring-Microcell zone concept 2.4 Basic idea of Path Loss and Multipath Fading 2.5 Multiple Access Techniques –Introduction-FDMA-TDMA- SSMA:- FHMA-CDMA-Hybrid Spread Spectrum Techniques-SDMA 2.6 GSM.

### **UNIT III**

#### **Satellite Communication (16 hrs)**

3.1 Satellite Communication Fundamentals-Satellite Orbits-Satellite Positioning-

Frequency Allocations-Polarization-Antennas—gain-beam width-Multiple Access Techniques 3.2 Geostationary Satellite communication-Satellite parameters 3.3VSAT (Basic Idea) 3.4Geostationary Satellite Path/Link Budget 3.5 Satellite TV Systems-Satellite TV broadcasting 3.6GPS.

#### **UNIT IV**

##### **Fiber Optics Communication(20 hrs)**

4.1 Introduction 4.2 Ray theory transmission-Total Internal Reflection-Acceptance Angle-Numerical aperture-Skew rays 4.3 Electromagnetic mode theory for optical propagation-Electromagnetic waves-Modes in a planar guide-Phase and group velocity 4.4 Fiber Classification-cylindrical fiber-Step Index- Graded Index-Single mode fiber:- Cut off wave length-Group delay -Photonic crystal fibers:-Index guided micro structures-Photonic band gapfibers 4.5 Dispersion:- chromatic-intermodal-Non linear effects 4.6 Optical fiber connection-Fiber Splices:-Fusion splices- Mechanical splices-Multiple splices-Fiber connectors:- Cylindrical ferrule connectors, Duplex and multiple-fiber connectors-Fiber couplers(basic idea).

#### **UNIT V**

##### **Radar Systems (16 hrs)**

5.1 Basic Principles –Fundamentals:- Basic radar Systems-Development of Radar-Radar Performance Factors:—Radar range equation-factors influencing maximum range-Effects of noise- Target properties 5.2 Pulsed Systems-Block diagram anddescription-Antennas and Scanning:-Antennas Scanning- Antenna tracking-Display Methods5.3 Pulsed radar systems-Moving Target Indication:- Doppler Effect-Fundamentals of MTI-Delay Line- Blind speeds-Radar Beacons5.4Other radar systems-CW Doppler Radar-Frequency Modulated CW Radar-Phased ArrayRadars-Planar Array Radars.

##### **Recommended Text Books:**

1. Electronic Communication Systems by Kennedy/Davis, Mc Graw Hill Publication, 4<sup>th</sup> edition,(Module-1 and 5).
2. Wireless Communication Principles and Practice by Theodore S Rappaport, Person Publication, 2<sup>nd</sup> Edition, (Module-2).
3. Telecommunication Transmission Systems by Robert G Winch, McGrawHill

Publication, 2<sup>nd</sup> edition, (Module-3).

4. Optical fiber communications-Principles and Practice John M Senior, Pearson publications, 3<sup>rd</sup> edition, (Module-4).

#### **Recommended References:**

1. Optical Fiber Communications by Gerd Keiser (Module-2).
2. Satellite Communications by Dennis Roddy, Mc Graw Hill Publication, 3<sup>rd</sup> edition.
2. Introductions to RADAR Systems by Skolnik, McGraw Hill, 3<sup>rd</sup> edition
3. Satellite communication by Dr.D.C Agarwal.
4. Electronics Communication Systems by Wayne Thomas, Pearson Publication, 5<sup>th</sup> Edition.

#### **PH800302: ADVANCED PRACTICALS IN ELECTRONICS**

Total credit: 5

Total hours: 180

(Minimum of 12 Experiments should be done choosing at least 2 experiments from each group)

#### **[A] Microprocessors and Micro Controllers (use a PC or 8086- $\mu$ p kit)**

1. Sorting of numbers in ascending/descending order.
2. Find the largest and smallest of numbers in array of memory. Conversion of Hexadecimal number to ASCII and ASCII to Hexadecimal number.
3. Multi channel analog voltage measurements using AC card.
4. Generation of square wave of different periods using a microcontroller.
5. Measurement of frequency, current and voltage using microprocessors.

#### **[B] Communication Electronics**

6. Generation PAM and PWM
7. Frequency modulation and demodulation using IC –CD4046.
8. Multiplexer and demultiplexer using digital IC 7432.

9. Radiation characteristics of a horn antenna.
10. Measurement of characteristic impedance and transmission line parameters of a coaxial cable.

**[C] Electronic Instrumentation**

11. DC and AC milli-voltmeter construction and calibration.
12. Amplified DC voltmeter using FET.
13. Instrumentation amplifier using a transducer.
14. Generation of BH curve and diode characteristics on CRO.
15. Voltage to frequency and frequency to voltage conversion.
16. Construction of digital frequency meter.
17. Characterization of PLL and frequency multiplier and FM detector.

**[D] Optoelectronics**

18. Characteristic of a photo diode - Determination of the relevant parameters.
19. Beam Profile of laser, spot size and divergence.
20. Temperature co-efficient of resistance of copper.
21. Data transmission and reception through optical fiber link.

**References**

**BUNCH-B MATERIAL SCIENCE**  
**PH810301: SOLID STATE PHYSICS FOR MATERIALS**

Total Credits: 3

Total Hours: 54

**UNIT I**

**Crystal defects [18h]**

- 1.1 Crystal Imperfection- point imperfections- vacancy, Frenkel and Schottky imperfections,
- 1.2 dislocations- Edge, screw, Burger's vector critical resolved shear stress,
- 1.3 dislocation motion , dislocation reaction, dislocation energy, slip;
- 1.4 surface and volume imperfections – stacking faults; Fracture, twinning [Ref. 5]
- 1.5 Voids in close packing- size, coordination and significance,
- 1.6 Pauling's rule and applications; Allotropy, polymorphism [Ref. 4]; polytypism

**UNIT II**

**(A) Atomic Diffusion [6h]**

- 1.1 Fick's laws, solution and applications;
- 1.2 Kirkendall effect, Atomic model of diffusion and other diffusion processes and mechanisms

**(B) Crystal binding: [12h]**

- 1.3 Crystals of inert gas, Van der Waals- London interaction, Repulsive interaction, equilibrium lattice constants, cohesive energy, Ionic crystals- Madelung energy, Madelung constant,
- 1.4 Covalent crystals, metals, hydrogen bond; Born-Haber cycle

**UNIT III**

**(A) Phase diagrams: [6h]**

- 3.1 Phase diagram rules, unary and binary phase diagrams,
- 3.2 microstructural changes during cooling, applications

## **(B) Excitations in solids [12h]**

3.3 Plasma optics, plasmons;

3.4 Polaritons, LST relation;

3.5 electron-phonon interaction: polarons;

3.6 Kramers Kronig Relations; excitons- Frenkel and Wannier excitons, electron hole drops;

3.7 Magnons- spin wave quantization and thermal excitation of magnons.

### **Recommended textbooks:**

1. Materials Science and Engineering- V Raghavan-PHI
2. Introduction to solid state physics- C Kittel- Wiley India
3. Solid State Physics- Wahab- Narosa

### **Recommended References:**

1. Lectures on Solid State Physics- Georg Busch & Horst Schade; Pergamon Press
2. Callister's Materials Science and Engineering- Wiley India
3. Elementary Solid State Physics: M Ali Omar- Pearson
4. Solid State Physics- S O Pillai- New Age;
5. Introduction to solids- Azaroff-TMH;
6. Solid State Physics- Adrianus J Dekker- Macmillan

## **PH810402: SCIENCE OF ADVANCED MATERIALS**

Total Credits: 3

Total Hours: 90

### **Course Objectives**

To provide a comprehensive understanding of ceramics, polymers, composites, and their applications in materials science.

To explore the principles and applications of photonic materials and photonics.

To equip students with the theoretical background to analyze advanced material systems for innovative research and technological applications.

## **Unit I**

### **Fundamentals of Materials Science (15 Hrs)**

1.1 Introduction to Advanced Materials: Classification and applications.

1.2 Structure of Materials: Crystalline and amorphous structures, crystal defects, and their impact.

1.3 Electronic Properties of Materials: Band theory, semiconductors, conductors, and insulators.

1.4 Thermodynamics of Materials: Phase diagrams and phase transitions.

1.5 Mechanical Properties of Materials: Stress-strain behavior, toughness, and hardness.

#### **(A) Optical properties of materials [10h]**

1.6 Absorption processes, photoconductivity, photovoltaic effect, colour centers- types and generation

1.7 Luminescence – photoluminescence, cathodoluminescence, electroluminescence, injection luminescence, radiative recombination Gaussian Beam- Amplitude, properties, quality; [Ref 1]Optical coherence- temporal, spatial

## **Unit II**

### **Ceramics, Polymers, and Composites (25 Hours)**

#### **A) Ceramics**

2.1 Types, Properties, and Applications of Ceramics:

2.2 Glass, clay, refractories, abrasives, cements, advanced ceramics, piezoelectric ceramics.

2.3 Perovskite Structure and Ferroelectric Materials:

2.4 Classification of ferroelectric materials and dielectric breakdown.

#### **B) Polymers**

2.5 Polymer Structure and Configurations: Thermosetting and thermoplastic polymers, copolymers, and conducting polymers.

2.6 Mechanical Behavior of Polymers: Mechanisms of deformation and strengthening.

2.7 Thermal Properties: Crystallization, melting, and glass transition.

2.8 Polymer Types and Applications: Plastics, elastomers, fibers, polymerization processes.

### **Unit III**

#### **Photonic Materials and Applied Photonics (20 Hours)**

##### **LEDs (5 Hours):**

3.1 Principles, structure, materials, and characteristics of LEDs.

3.2 Heterojunction LEDs, SLED, and ELED.

##### **Solar Cells (5 Hours):**

3.3 Principles, characteristics, and designs:

3.4 PERL, heterojunction, cascaded, and Schottky barrier cells.

3.5 Material and design considerations.

##### **Advanced Photonic Materials (7 Hours):**

3.6 Photonic Crystals: Basic concepts and features.

3.7 Liquid Crystals: Optical properties and applications.

3.8. Metamaterials: Optics of metamaterials and their unique properties.

3.9 Amorphous Semiconductors: Characteristics and applications.

3.10. Detector Arrays: Charge-coupled devices (CCDs).

##### **Special Optical Effects (3 Hours):**

3.11 Electro-optic effect, magneto-optic effect, and acousto-optic effect.

#### **Unit IV: Applications of Advanced Materials (20 Hours)**

4.1 Energy Applications: Materials for solar cells, batteries, and supercapacitors.

4.2 Biomedical Applications: Biocompatible materials, drug delivery systems, and tissue engineering.

4.3 Sensors and Actuators: Optical, chemical, and mechanical sensor materials.

4.4 Environmental Applications: Materials for water purification and carbon capture.

## References

1. Essentials Of Modern Materials Science And Engineering, James Newell, John Wiley and Sons International.
2. Materials Science and Engineering: An Introduction by William D. Callister and David G. Rethwisch.
3. Introduction to Solid State Physics by Charles Kittel.
4. Fundamentals of Ceramics by Michel Barsoum.
5. Polymer Science by V.R. Gowariker, N.V. Viswanathan, and Jayadev Sreedhar.
6. Semiconductor Optoelectronic Devices by Pallab Bhattacharya.
7. Photonic Crystals: Molding the Flow of Light by J.D. Joannopoulos et al.

## PH810403: NANOSTRUCTURES AND MATERIALS CHARACTERISATION

Total Credits: 3

Total Hours: 90

### UNIT 1

#### Nanostructures: Synthesis and properties [25 h]

1.1 Applications of Schrodinger equation in nanoworld: particle confined in one dimension, quantum leak, penetration of barrier, 1.2 nanostructures for electronics- quantum dots, nanowires, superlattices and heterostructures 1.3 Preparation of quantum nanostructures, size and dimensionality effects, single electron tunnelling. Metal nanoclusters, semiconducting nanoparticles, 1.4 Synthesis routes: bottom up approaches- PVD, CVD, PLD, wet chemical; 1.5 top down synthesis routes- mechanical alloying, nanolithography.

### UNIT II

#### Nanomaterials and applications [20 h]

2.1 Carbon nanostructures: carbon clusters, fullerenes, CNTs- fabrication, properties and applications , 2-D nanostructure- graphene, other 2D materials like TMD's- properties and application superparamagnetic nanoparticles, GMR, ferrofluids, colossal magnetoresistance, superhydrophobic nanostructured surfaces, biomimetics; 2.3 nanomachines and nanodevices- MEMs, NEMs, nanosensors, 2.4 Properties and

important optoelectronic applications of nano ZnO and TiO<sub>2</sub>

### UNIT III

#### Optical Absorption and Emission spectroscopy [20 h]

3.1 Instruments for absorption photometry – radiation sources, wavelength selection, cells and sampling devices, detectors; Fundamental laws of photometry (Beer Lambert's law), spectrophotometric accuracy, precision, absorptivity, bathochromic and hypsochromic shift, Jablonski diagram 3.2 Principles of Fourier transform optical measurements- advantages of Fourier transform spectrometry, time domain spectrometry, fourier transform of interferograms. 3.3 optical atomic spectra- atomic line widths, effect of temperature; 3.4 Principles and applications of Differential, difference and derivative spectroscopy, photoacoustic and thermal lens spectroscopy; General applications of uv absorption spectroscopy 3.5 Theory of fluorescence and phosphorescence spectrophotometry, PL power, total luminescence spectroscopy, fluorescence lifetime measurements, quenching and applications, principle and applications of chemiluminescence, Qualitative ideas of resonance raman spectroscopy, surface enhanced raman spectroscopy,

### UNIT IV

#### Chemical, thermal and X-ray diffraction methods [25 h]

4.1 X ray diffraction- production and detection of X-rays and X-ray spectra, Moseley's law, Geometry of an X-ray diffractometer, [Ref 3] 4.2 X-ray photoelectron spectroscopy, X-ray fluorescence, Particle size determination, Debye Scherrer formula, stress measurement Auger recombination, Auger Emission Spectroscopy, 4.3 Working of SEM, TEM, AFM and STM with instrumentation 4.4 **Mass spectrometry**: ionization methods, mass spectrometers and analyzers, correlation of mass spectra with molecular structure. 4.5 **Thermal methods**: thermogravimetry, DTA, DTG, DSC, potentiometry, voltammetry and electrogravimetry.

#### Recommended Text Books: (Unit 1 & 2)

1. Introduction to nanotechnology: Charles P Poole, Frank J Owens-Wiley india
  2. Textbook of nanoscience and nanotechnology- B S Murty, P Shankar, Baldev Raj, B B Rath, James Muday- Springer Univ. Press
  3. Introduction to nanoscience and nanotechnology- KK Chattopadhyay and A N
- PROGRAM STRUCTURE & SYLLABUS M. Sc PHYSICS Page No

Banerjee-PHI

4. Introduction to Nanoscience- S M Lindsay, Oxford University Press.

**Recommended Text Books: (Unit 3&4)**

1. Instrumental methods of analysis- Williard, Merritt, Dean, Settle- CBS
2. Introduction to nanoscience and nanotechnology- KK Chattopadhyay and A N Banerjee-PHI
3. Introduction to Nanoscience- S M Lindsay, Oxford University Press.
4. Principles of Instrumental analysis- Holler, Skoog, Crouch-Cenage

**Recommended references:**

1. Instrumental methods of chemical analysis-Chatwal, Anand- Himalaya
2. Instrumental methods of chemical analysis- Galen W Ewing-MGH
3. X ray diffraction a practical approach :C Suryanarayana, M Grant Norton; Springer
2. Nanophotonics- Paras N Prasad: Wiley
3. Nanostructures and nanomaterials- G Cao and Y Wang- World Sci.
4. Graphene: Synthesis, Properties and Applications in Transparent electronic devices- P Kumar etal- Reviews in Advanced Sciences and Engineering, vol 2, pp1-21, 2013
5. Recent publications in TMDs focussing on the properties and applications.

**PH810302: ADVANCED PRACTICALS IN MATERIAL SCIENCE**

Total credit: 5

Total hours: 180

*\* Minimum number of experiments to be done 12*

*\*\*Error analysis of the result is a compulsory part of experimental work*

1. Malu's law- verification
2. Optical activity- specific rotation measurement
3. Stefan's constant- torch bulb filament resistance measurement

4. Absorption coefficient of solution- path length and concentration dependence
5. XRD- Crystal Structure Determination Cubic/Hexagonal
6. XRD-Lattice Parameter Measurements
7. XRD- Phase Diagram Determination
8. XRD-Determination of Crystallite Size and Lattice Strain
9. Zeeman effect- shift of atomic energy levels
10. Laser- measurement of thread angle, pitch and the diameter of a micrometre screw
11. Thin film thickness- Newton's rings/ Michelson interferometer
12. Magneto-optic effect - Determination of Verdet constant
13. Michelson interferometer /Edser Butler method/ Fresnel's biprism- mica sheet thickness
14. Bandgap- semiconductor diode
15. Laser –Young's double slit - interference
16. Refractive index of liquid- Newton's ring /Laser/ Fresnel's biprism
17. Resolving power- lens- Laser
18. Rydberg constant- Hydrogen discharge tube
19. Particle size – corona plate
20. Comparison of thickness of thin sheets by air wedge
21. Band gap and type of optical transition (direct or Indirect using Tauc relation) from absorption spectra
22. Synthesis of metallic (Ag or Au) nanoparticles in aqueous medium and estimation particle size using absorption spectrum. Thermal analysis of materials from experimental data
23. Analysis of FTIR spectrum
24. Solar cell- efficiency& Fill factor
25. Laser diffraction- comparison of thickness of wires of different gauges

26. Thermistor –parameters [energy band gap]
27. Temperature sensor- silicon diode and thermocouple
28. Optical fiber- bending loss
29. Fermi energy of copper
30. ESR spectrometer- g factor
31. Verification of laws of geometrical optics- reflection and transmission coefficients, critical angle, refractive index of glass slab/ prism
32. Study of Bravais lattices with the help of models
33. Verification of Fresnel's equations
34. Spring constant-static and dynamic method
35. Coherence length of LED
36. Comparison of resistance variation of a carbon film resistor, metal wire, semiconductor and thermistor with temperature
37. Thermal diffusivity of brass
38. Young's modulus- strain gauge
39. Michelson interferometer- Sodium D lines separation
40. Fresnel's biprism- wavelength of monochromatic light
42. TEM Analysis

#### **References:**

1. A course of experiments with He-Ne laser- R S Sirohi, Wiley
2. Practical Physics- C L Arora, S Chand
3. X ray diffraction a practical approach :C Suryanarayana, M Grant Norton; Springer
4. Practical Physics: D Chattopadhyay, P C Rakshit; New Central Book Agency
5. Advanced practical physics: Chauhan, Singh; Pragati Prakashan

## **BUNCH C- INFORMATICS**

### **PH820301: PROGRAMMING IN JAVA AND HTML**

Total Credits : 3

Total Hours : 54

Objectives:

To equip the students with concepts of object oriented programming principles and skills in web programming.

#### **UNIT I : (14 Hrs)**

Fundamentals of Object Oriented Programming, Overview of Java Language – constants, variables and data types: Integers - Floating point – Characters – Boolean, type conversion and casting, Operators: Arithmetic operators –Bitwise operators, Relational operators – Boolean logical operators – Assignment operators – Conditional operators - expressions

Decision making and branching: simple if, if - else, if - else if, switch - case, Decision making and Looping: for, while, do - while, example programs

#### **UNIT II: (16 Hrs)**

Strings, arrays: one dimensional array – multidimensional array, vectors, class: fundamentals – declaring objects – introducing methods – constructors – garbage collection – finalize() method, overloading methods, inheritance: basics – types – use of super keyword – method overriding, interfaces – basics only, packages – introduction – importing packages , access protection, exception handling – introduction – exception types – using try and catch, Multithreaded programming: java thread model – life cycle, Applets – introduction only.

#### **UNIT III: (14 Hrs)**

Basic Hypertext elements – HTML, Head, Title, Body tags - paragraphs, formatting of text: headings - formatting tags – pre tag – font tag – anchors – links - lists: unordered list- ordered list – Definition list, tables - <table>, <tr>, <td> tags, cell spacing, cell padding, colspan and rowspan, forms: forms and input tag – text box – radio button – check box – select tag and pull down list – submit and reset.

#### **UNIT IV (10 Hrs)**

Introduction to scripting, purpose of scripting, javascript: variables – data types – statements – operators , control structures: conditional statements - loop statements, break and continue, functions, Document methods: write and writeln methods, message boxes: dialog boxes – alert - prompt- and confirm boxes. Events familiarization: OnLoad, OnClick, OnSubmit.

##### **Recommended Text Books:**

1. Programming With Java – A Primer, E. Balagurusamy 3rd Edn TMH. Text Book
2. HTML, The Complete Reference, Tata Mc Graw Hill
3. Beginning JavaScript, Paul Wilton, Wrox Press Inc. 1<sup>st</sup>

##### **Recommended Reference Books:**

1. JAVA2, The Complete Reference, Herbert Schildt, 4th Edn. TMH
2. HTML4, 2nd Edn. Rick Darnell, Techmedia
3. Mastering HTML4 – Ray D S and Ray E J - BPB
4. Eloquent Java Script A modern introduction to programming – Marijn Haverbeke
5. Essential Javascript – A javascript Tutorial
6. JavaScript Programmers Reference, Cliff Wootton, Wrox Press Inc.

#### **PH820402: DATA COMMUNICATION AND COMPUTER NETWORKS**

Total Credits : 3

Total Hours : 90

Objectives:

To equip the students with concepts of data communication techniques and network principles and security features.

#### **UNIT I (24 Hrs)**

Data Communication Terminology: – Channel – Baud – Bandwidth - Frequency. Modes of data transmission : Serial and Parallel - Synchronous, Asynchronous & Isochronous Communications - Analog & Digital Data Transmission - Transmission impairments – Attenuation-Delay Distortion Noise - Concept of Delays. Transmission

Media and its Characteristics: – Magnetic media - Twisted pair-Base band coaxial cable - Broadband Coaxial cable - Optical Fiber - Comparison between optical fiber and copper wire - Wireless transmission – Microwave Transmission - Radio Transmission - Infrared and millimeter waves - Wireless LAN.

#### **UNIT II (18 Hrs)**

Multiplexing: FDM – TDM, Switching paradigms: circuit - packet and cell switching – propagation delay – clock synchronization. Network access control: Centralized – decentralized - distributed Overview of satellite communication – Fourier series & transforms and their applications to data communication.

#### **UNIT III (20 Hrs)**

Computer Networks: Importance of Networks – Components of Networks - Classification of Networks: Broadcast networks - Switched networks, Switching Techniques, Types of Networks: LAN – MAN – WAN. Networking Models: OSI reference model – TCP/IP reference model, Network Topology: Bus-Star-Ring-Tree-Mesh-Cellular, Network Architecture: Client/Server - Peer-to-Peer.

#### **UNIT IV (28 Hrs)**

The Internet: Internet Protocols: Internet Protocol (IP) - Transmission Control Protocol (TCP), Internet Address: Structure of Internet Servers Address - Address Space, Internet Infrastructure, Services on Internet, Domain Name System, SMTP and Electronic mail, Http and World Wide Web, Usenet and News groups-FTP-Telnet(18 Hrs) Network Security: Security requirements and attacks - Cryptography – introduction - Substitution ciphers - Transposition ciphers -Ideas of secret key Algorithms and Public key Algorithms - Digital Signature, E-mail Privacy - Internet Tools – Search Engines-Web browsers (10 Hrs)

#### **Recommended Text Books:**

1. Data and Computer communication, William Staling, 7th Edn. PHI
2. Computer Networks, A.S. Tanenbaum, PHI
3. Internet and World Wide Web, Harvey M. Deitel, PHI

## **PH 8204 03: COMPUTER APPLICATIONS IN PHYSICS**

Total Credits : 3

Total Hours : 90

Objectives:

To equip the students with knowledge in MATLAB and Python Programming language.

### **UNIT I (28Hours)**

#### **Introduction to MATLAB**

Representing numbers in a computer – Machine precision – Introduction to numerical errors – Errors in mathematical approximations – Error propagation – Introduction to MATLAB – Workspace – Creating arrays –Matrix operators – Generating vectors– Infinite loops –Introduction to *Mfiles*– Graphics in MATLAB – Creating 2D graphs – Introduction to Mesh and Surface plots (12 Hrs).

Constructing Real and Complex Variables, Symbolic Math Functions, Derivatives of Expressions with Several Variables, Integration with Complex Parameters, Symbolic Summation, Taylor Series, Finding the Maximum, Minimum and inflexion points, Singular Value Decomposition, Systems of Nonlinear Equations. (16 Hrs).

### **UNIT II (20 Hours)**

#### **MATLAB Toolboxes**

Introduction to tool boxes - MATLAB Tools for Fourier Analysis, Short-Time Fourier Analysis, MATLAB tools for Wavelet Analysis, Continuous Wavelet Transform, Scaling, Shifting, ,One-Dimensional Complex Continuous Wavelet Analysis – instrument control toolbox – partial differential equation toolbox – finite element method.

Ordinary Differential Equations, Decay of a Radioactive Sample, Simple Harmonic Oscillator, Basics of Artificial Neural Network and its applications.

### **UNIT III (18 Hours)**

#### **Introduction to Python**

Variables and Data Types, Strings, Lists (split, join, copy), Operators and Precedence, I/O operations, Iteration: while and for, Conditional Executions, Functions, Modules

and Packages, File Input/output, Dictionaries. Numpy Module, Creating Arrays, Vectorized Functions, Exception Handling.

#### **UNIT IV (24 Hours)**

##### **Visualisation of Data using Matplotlib**

Matplotlib Module - Multiple plots, Polar plots, Pie Charts, Plotting Sine, Log, Exponential, Plotting mathematical functions, Fourier Series

Numerical Methods: Derivative of a function, Numerical Integration, Polynomials, Finding roots of an equation, System of Linear Equations, Least Squares Fitting, Interpolation.

##### **Recommended Textbooks:**

1. Introduction To Matlab, Ross L. Spencer And Michael Ware
2. Artificial Neural Networks-B.Vegnanarayana
3. Duane C. Hanselman and Bruce L. Littlefield (2004).*Mastering MATLAB*  
7. Prentice Hall
4. Introduction to Matlab, R.L. Spencer & M. Ware, Brigham Young University (2010)
5. Python for Education, Ajith Kumar B.P.,
6. Computational Physics Problem Solving with Python, RUBIN H. LANDAU, JOSE, CRISTIAN, Publisher: Wiley, Third Edition.

##### **Recommended References:**

1. J.M. Thijssen (1999). *Computational Physics*. Cambridge University Press.
2. NEURAL NETWORKS-Algorithms, Applications and Programming Techniques – James A Freeman and David M. Skapura
3. Tao Pang (1997). *An Introduction to computational physics*. Cambridge University Press.
4. Rubin H. Landau (1997). *Computational Physics: Problem solving with computers*. John Wiley.
5. James B. Scarborough. *Numerical mathematical analysis*. Oxford IBH

## PH820302PRACTICALS IN INFORMATICS

Total Credit 5

Total hours 180

1. (a) Create an interface having two methods – division and modulus. Create a class which overrides these methods.  
(b) Write and execute a program in java to display the names and register numbers of students. Initialize the respective array variables for 10 students. Handle `ArrayIndexOutOfBoundsException` Exception so that any such problem does not cause illegal termination of program.
2. Write a java program to find the area of Square, Rectangle, and Triangle using the concept of polymorphism.
3. A program to demonstrate multilevel inheritance.
4. Write and execute a program to introduce method overloading.
5. Write a java program to create a thread using `Thread` class.
6. Write a java program to create and implement an Interface.
7. Define a class called student with data members name, roll number and age. Write a suitable constructor and method `output()` to display the details. Derive another class `student1` from `student` with data members height and weight. Write a program to read and display data.
8. (a) Write a program for generating two threads, one for printing even numbers and the other for printing odd numbers.  
(b) Write a program to read a statement from console, convert it into upper case and print it on console.
9. Write and execute a java program to display an ordinary working calculator on the screen. The digits and arithmetic signs are to be displayed on the buttons.
10. Write a program to introduce a 'text field' and 'text area' activated by three buttons.
11. Write and execute an applet in Java to display the applet with following conditions
  - (a) There should be a menu with options `LINE`, `RECTANGLE`, `CIRCLE`, `ELLIPSE` and `EXIT`.
  - (b) If the option `ELLIPSE` is selected and if the mouse is clicked and dragged, an ellipse with varying size should be displayed on the screen.

- (c) Suitable display should be generated when other options other than EXIT are selected.
- (d) When EXIT is selected the applet should exit from the screen.
12. Write a Java applet which reads your name and address in different text fields and when a button named find is pressed the sum of the length of characters in name and address is displayed in another text field. Use appropriate colors and layout to make your applet look good.
13. (a) Create a Web page with appropriate content and insert an image towards the left hand side of the page. When the user clicks on the image it should open another web page. (b) Create a Web page. When the user clicks on the link it should go to the bottom of the page.
14. Design a single page web site for a university containing a description of the courses offered. It should also contain general information about the university such as its history, the campus and its unique features and so on. The site should be colored and each section should have a different color.
15. Make out a brief Bio – data of yours and code it as an HTML page. Use tables to show your academic history.
16. Create a web page having two frames, one containing the links and when the links are clicked appropriate contents should be displayed in frame2.
17. Design a page with a text box called “name” and a button with label “enter”. When you click on the button another page should open, with the message “welcome <name>” where the name should be equal to the name entered in the first page.
18. Create a web page having minimum of four pages with home page containing links to other pages and also should have return links. Use maximum number of tags in the program.
19. Create an HTML form that inputs student details and when submitted display the same on the HTML page.
20. Design a biodata form.
21. Create a web page showing your personal information using text boxes, radio buttons, check boxes, Select tag and Pull Down lists. The form should contain First name, Middle name, Last name, Date of Birth, Marital status, Gender, Pin code, Country, Education, Annual income, City, state, Occupation, Industry etc.

22. (a). Write a Java Script code block using arrays and generate the current date in words. This should include the day, the month and the year.(b) Write a java script code that converts the entered text into upper case.(c) Write a program to display the multiplication table.
23. (a)Write a Java script code to accept radius and display the area of the circle.(b) Write a code to create a Scrolling text in a text box. (c) Using Java script create a digital clock.
24. Write and execute a Matlab program to simulate a single phase half – wave diode rectifier supplying a resistive load of 2 ohms from an ac source of 230V and 50Hz. Draw the wave form of output voltage and current delivered to the load with following assumptions.
- (a) The switch is ideal, the diode resistance  $R_d = 0$ ; source inductance  $L_s = 0$
- (b) The switch is ideal, the diode resistance  $R_D = 0.2$  ohms; source inductance  $L_s = 0$
25. Write and execute a Matlab program to design an IIR low pass filter using Butterworth prototype and impulse invariant transformation.

**BUNCH D – THEORETICAL PHYSICS**  
**PH830301 : GENERAL RELATIVITY AND APPLICATIONS**

Total Credits : 3

Total Hours : 54

Objectives: To introduce General Relativity and its mathematical techniques along with important applications so as to initiate students towards a wide spectrum of research problems that make use of these.

**Unit I** (18 hours)

**Basics of relativity, Tensor analysis**

1.1 Overview of special relativity-Principles of special relativity, 1.2 Line interval - Proper time, 1.3 Lorentz transformation, 1.4 Minkowski spacetime Lightcones, 1.5 Relativistic momentum 4-vectors, 1.6 Lorentz transformation of electromagnetic field, 1.7 Energy Momentum tensor for a fluid, perfect fluid, 1.8 Conceptual foundations of GR and curved spacetime - Principle of equivalence, 1.9 Connection between gravity and geometry, 1.10 Metric tensor and its properties, metric in

Newtonian limit 1.11 Concept of curved spaces and spacetimes, 1.12 Tangent space and four vectors, Tensor algebra, 1.13 Tensor calculus, Covariant differentiation.

## **Unit II (18 Hours)**

### **Einstein's field equations**

2.1 Parallel transport, 2.2 Riemann curvature tensor, 2.3 Geodesics - Particle trajectories in gravitational field, 2.4 Einstein's field equations, 2.5 Definition of the stress tensor, 2.6 Bianchi identities and conservation of the stress tensor, 2.7 Einstein's equations for weak gravitational fields, Newtonian limit. 2.8 Derivation of Schwarzschild metric, Basic properties of Schwarzschild metric coordinate- systems and nature of  $R=2M$  surface, 2.8 Effective potential for particle orbits in Schwarzschild metric, 2.8 Deflection of ultra relativistic particles, 2.9 Gravitational red-shift.

## **Unit III (9 Hours)**

### **Applications of General Relativity**

3.1 Gravitational waves - Wave equation in linearised theory, 3.2 Plane waves, 3.3 Transverse traceless gauge, 3.4 Effect on test particles, 3.5 Principles of detection and generation of gravitational waves, 3.6 Types of detectors(qualitative), 3.7 Hulse Taylor binary pulsar.

## **Unit IV (9 Hours)**

### **Cosmology**

4.1 Models of the universe, 4.2 Einstein universe, 4.3 Expanding universe, Simplifying assumptions, 4.4 Hubble's law, 4.5 Friedmann models: Einstein equations, 4.6 Energy tensors - Solutions to Friedman equations.

Text Books:

1. First course in general relativity, B. F. Schutz; Cambridge University Press. (Units I, II, III)
2. Introduction to Cosmology, 3rd Edition, J. V. Narlikar, Cambridge University Press. (Unit IV)

### **Reference:**

1. Gravitation and Cosmology: Principles and Applications of General Theory of Relativity, Steven Weinberg; John Wiley & Sons.

2. Classical Theory of Fields, Vol. 2: L. D. Landau and E. M. Lifshitz, Oxford : Pergamon Press.
3. General Relativity and Cosmology, J. V. Narlikar Delhi: Macmillan Company of India Ltd.
4. Gravitation, Charles W. Misner, Kip S. Thorne, John A. Wheeler; W. H. Freeman and Company.

### **PH830402: NONLINEAR DYNAMICS**

Total Credits : 3

Total Hours : 90

Objective: To introduce the students the Philosophy and Methods of Nonlinear dynamics. For a complete course, numerical experiments are necessary and a portion of the time is allocated for computational implementation of a few important topics in each unit.

#### **Unit I (33 hrs)**

1.1 A brief history of Nonlinear dynamics. 1.2 Importance of Nonlinear dynamics. 1.3 World as a dynamical system. 1.4 One dimensional flows. 1.5 fixed points. 1.6 Linear stability analysis. 1.7 Bifurcations. 1.8 saddle-Node bifurcation. 1.9 Transcritical bifurcation. 1.10 Pitchfork bifurcation. 1.11 Potentials. 1.12 Uniform and non uniform oscillators. 1.13 Two dimensional flows. 1.14 Phase portraits. 1.15 existence and uniqueness. 1.16 Fixed points and linearization linearization (of one dimensional flows). 1.17 Limit cycles. 1.18 Poincare Bendixon theorem.

#### **Unit II (12 hrs)**

2.1 Phase portraits. 2.2 Numerical computation of phase portraits. 2.3 Fixed points and linearization (of two dimensional flows). 2.4 Lorenz equations. simple properties of Lorenz equations. 2.5 Chaos on a strange attractor. 2.6 Defining Attractor and Strange attractor. 2.7 Lorenz map-ruling out stable limit cycles. 2.8 exploring parameter space.

#### **Unit III (30 hrs)**

3.1 One dimensional maps. 3.2 Fixed points and linear stability. 3.3 Logistic map: numerics. 3.4 Logistic map: analysis. 3.5 Liapunov exponent. 3.6 Fractals. 3.7 countable and uncountable sets. 3.8 Cantor set. 3.9 Dimension of self similar fractals.

3.10 Box dimension 3.11 Pointwise correlation dimensions. 3.11 Baker's map, Henon map 3.12 Elementary properties of Henon map 3.12 Roessler system. 3.13 Forced double well oscillator - Magneto-Elastic mechanical system.

#### **Unit IV (15 hrs)**

4.1 Chatter in Machine Tools 4.2 Correlations among data points. 4.3 Prediction of the displacement. 4.4 Reconstruction of Phase space. 4.5 Observed Chaos. 4.6 Embedding: Phase space reconstruction. 4.7 Geometry of Phase space reconstruction.

#### **Text Book**

1. Strogatz, Steven H. Nonlinear Dynamics and Chaos: With Applications to Physics, Biology, Chemistry, and Engineering. Westview Press, 2014.
2. Analysis of Observed Chaotic Data, Abarbanel, Henry D.I., Springer, 1995.

#### **Reference Books:**

1. Deterministic Chaos, N. Kumar, Universities Press.
2. Chaos and Nonlinear Dynamics, RC. Hilborn, Oxford University Press.
3. Chaotic Dynamics: An Introduction, G.L. Baker, and J.P. Gollub, CUP, 1993.
4. Chaos in Dynamical System, E. Ott, Cambridge University Press.
- 4 . S. Neil Rasband, Chaotic Dynamics of Nonlinear Systems, Courier Dover Publications

### **PH830403: QUANTUM FIELD THEORY**

Total Credits : 3

Total Hours : 90

Objectives: To introduce quantum field theory and its techniques so as to enable the student to take up independent study of advanced techniques as well as research in high energy physics, statistical mechanics, condensed matter physics and various newly emerging applications.

#### **Unit I (27 Hours)**

##### **Classical fields**

1.1 Lagrangian, symmetries, gauge fields, 1.2 Real scalar – variational principle, Noether theorem, 1.3 Complex scalar field, Electromagnetic field, 1.4 Yang-Mills

field, 1.5 Maxwell and Proca equations, Canonical quantization: 1.6 Klein-Gordon field as Harmonic Oscillators, 1.7 Klein-Gordon field in space-time, 1.8 Lorentz invariance in wave equations, 1.9 Dirac equation, 1.10 Free particle solutions, 1.11 Dirac Matrices, Dirac Field Bilinears, 1.12 Quantization of Dirac field, 1.13 Discrete Symmetries of Dirac Theory

## **Unit II (20 Hours)**

### **Interactions**

2.1 Perturbation theory, 2.2 Perturbation Expansion of Correlation Functions, 2.3 Wick's Theorem, 2.4 Feynman diagrams, 2.5 Feynman rules for Fermions.

## **Unit III (20 hours)**

### **Path integral formulation of perturbation theory**

3.1 Path integral formulation, 3.2 Perturbation theory and S-matrix, 3.3 Coulomb scattering, 3.4 Functional calculus and properties of path integrals, 3.5 Generating functional for scalar fields - functional integration, 3.6 Free particle Green's functions, 3.7 Generating functional for interacting fields.

## **Unit IV (23 hours)**

### **S-matrix, Renormalization, Faddeev-Popov method**

4.1.  $\Phi^4$  Theory, 4.2 Generating functional for connected diagrams, 4.3 Fermions using functional methods, 4.4 S-matrix and reduction formula, 4.5 Divergences in  $\Phi^4$  theory, 4.6 Dimensional regularization of  $\Phi^4$  theory, 4.7 Renormalization of  $\Phi^4$  theory, 4.8 Faddeev-Popov quantization, Feynman rules for QED, 4.9 Ward-Takahashi identity.

### **Textbooks**

1. Quantum Field Theory, Lewis H Ryder, 2nd Edn, Cambridge University Press (1996). (1.1– 1.5 of Unit I, Unit III, Unit IV)
2. An Introduction to Quantum Field Theory, Michael E Peskin, Daniel V Schroeder, Westview (1995). (1.6 – 1.13 of Unit I, Unit II)

### **Reference:**

1. The Quantum Theory of Fields, Steven Weinberg, Cambridge University Press.
2. Quantum Field Theory, M Srednicki, Cambridge University Press (1996).
3. Critical Properties of  $\Phi^4$  Theories, Hagen Kleinert, Verena Schulte- Frohlinde, World Scientific (2001)

4. Relativistic Quantum Fields, J D Bjorken and S D Drell, McGraw Hill Company
5. Quantum Field Theory, C Itzykson, J-B Zuber, McGraw Hill Inc (1980).
6. Field theory: A Modern Primer, P Ramond, Benjamin-Cummins Publishing Co (1981)
7. Introduction to the Theory of Quantized Fields, N N Bogoliubov, D V Shirkov New York, (1959)

### **PH830302 : SPECIAL COMPUTATIONAL PRACTICALS**

Total credit: 5

Total hours: 180

Objective:

Equip the students to develop algorithms and programs for numerical experiments and handling data. Students may use any programming language and/or packages of their choice.

1. Trajectory of motion of (a) projectile without air resistance (b) projectile with air resistance.
2. Phase space of the harmonic oscillator with and without damping.
3. Phase space of a pendulum with and without damping.
4. Phase space of a driven damped pendulum.
5. Lyapunov exponents of the Logistic map with varying parameters.
6. Self similar structure of the Henon Map.
7. Phase space of chaotic Duffing Oscillator.
8. Bifurcation diagram of the Duffing Oscillator..
9. Poincaré section of chaotic Duffing Oscillator.
10. Bifurcation diagram of the Lorenz system.

11. Bifurcation diagram of the Roessler system system
12. Poincaré section of the Lorenz system.
13. Poincaré section of the Roessler system.
14. Lyapunov exponents of the Lorenz system.
15. Plotting of Julia set.
16. Plotting of Mandelbrot set.

## **CHAPTER IV**

### **PARALLEL PG-CSS PHYSICS PROGRAMME**

In this chapter, the details of a parallel PG-CSS programme is presented. This M.Sc. Physics-Material Science programme is taught in Catholicate College, Pathanamthitta affiliated to MG University. The number of hours per week, number of credit per course and the total hours per semester allocated to this course will remain the same as those for M.Sc. Physics programme as described in chapter 1. This programme has 12 core courses and 3 elective courses. The examination pattern and question paper model remain the same as that described in chapter 2. The details are given in the table.

#### **4.1 COURSE AND COURSE CODE OF M.Sc. PHYSICS - MATERIAL SCIENCE**

##### **Course Code**

The first two letters 'PH' stand for Physics and the digit '02' stands for model two: Material Science. The fifth and sixth character of the Code running from '01 to 04' indicates the semester concerned. All others are same as explained in section 1.5 of general description. Course and Course code of M.Sc. Physics - Material Science are given in Table.4.1

**Table 4.1: Structure of M.Sc. Physics - Material Science under PG-CSS 2019**

### The Elective Bunches:

There are two Electives Bunches offered in this parallel PG-CSS Physics programme. Each elective consists of a bunch of three theory courses and one laboratory course. The first theory course is placed in the Semester III, while the second and third theory and the laboratory course of a bunch are in Semester IV. An institution can select only one Elective Bunch in an academic year. The course structure of the Electives Bunches is given in Table 4.2

The Electives Bunches are named,

- (i) Bunch A : Material Science-I
- (ii) Bunch B : Material Science-II

**Table 4.2: The Elective Bunch**

**Bunch A: Material Science-I**

**Course code: 84**

Semester	Course Code	Course Title	No. of hrs / week	Credits
3	PH840301	THIN FILM SCIENCE AND CRYSTAL GROWTH TECHNIQUES	3	3
4	PH840402	NANOSCIENCE AND NANOTECHNOLOGY	5	3
4	PH840403	MATERIALS SCIENCE AND ENGINEERING	5	3
4	PH840404	MATERIAL SCIENCE PRACTICALS	10	5

**Bunch B: Material Science-II**

**Course code: 85**

Semester	Course Code	Course Title	No. of hrs / week	Credits
3	PH850301	OPTOELECTRONICS	3	3
4	PH850402	SEMICONDUCTOR DEVICES	5	3
4	PH850403	CERAMICS AND BIOMATERIALS	5	3
4	PH850404	ADVANCED MATERIAL SCIENCE PRACTICALS	10	5

## **4.2 SYLLABUS**

### **SEMESTER – I**

#### **PH020101: APPLIED MATHEMATICS FOR PHYSICS- I**

**Credit-4 (72 hours)**

**Objective of the course:** The purpose of the course is to introduce students to methods of mathematical physics and to develop required mathematical skills to solve problems in quantum mechanics, electrodynamics and other fields of theoretical physics. The first objective of this course is to develop student's facility with certain mathematical techniques. The second objective is to highlight applications of mathematical methods to physical systems. Applications shed light on both the mathematics and the logic underpinning physical models. This allows students to develop valuable intuition for subsequent courses where these same methods will be applied.

#### **Unit I**

##### **Vector Algebra and Vector Spaces (18 hrs)**

1.1 Review of vector analysis-vector calculus- Differential Calculus: Gradient, Divergence, Curl - Successive applications of grad – Integral calculus: line, surface & volume integrals 1.2 Fundamental theorem for gradients, divergences and curls - Equation of continuity - Potential theory - Gauss's law and Poissons equation 1.3 Orthogonal curvilinear coordinates: Spherical & Cylindrical - Differential vector operators in orthogonal coordinates 1.4 Linear vector spaces 1.4.1 Self adjoint, unitary & projection operators –Eigen values&Eigen vectors of self adjoint operators 1.5 Inner product space-Schmidtorthogonalisation - Hilbert space 1.6 Schwartz inequality

#### **Text Books**

1. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber 4<sup>th</sup> Edition, Academic Press (Chapter 1 & 2)
2. Mathematical Physics, P.K Chattopadhyay, New Age International (chapter 7)
3. Theory and problems of vector analysis, Murray R. Spiegel (Schaum's outline series)

## Unit II

### Matrices, Error analysis and Probability (12 hrs)

2.1 The algebra of matrices - Special matrices 2.2 Elementary transformations - Similarity transformation - unitary and orthogonal transformation. 2.3 Matrix inversion (Gauss-Jordan inversion method) - Solution of linear equation- Gauss elimination method- 2.4 Eigen values and eigenvectors - Diagonalisation using normalized eigenvectors - 2.5 Cayley-Hamilton theorem 2.6 Linear operators. Matrix representation - Orthogonal, Unitary and Hermitian matrices, normal matrices, Pauli spin matrices – Matrix mechanics (Qualitative Ideas)

#### Text Books

1. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber 4<sup>th</sup> Edition, Academic Press (Chapter 3)
2. Mathematical Physics, P.K. Chattopadhyay, New Age International (Chapter 7)
3. Mathematical Physics, H.K. Dass, S. Chand & Co. New Delhi.

### Error analysis and Probability (6 hrs)

2.7 Error analysis- Propagation of errors- Standard deviation 2.8 Binomial, Poisson and Gaussian distributions.

#### Text Books

1. Mathematical methods for Physics and Engineering, K.F. Riley, M.P. Hobson, S. J. Bence, Cambridge University Press (Chapter 24)
2. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber 4<sup>th</sup> Edition, Academic Press. (Chapter 19)
3. An Introduction to Error Analysis: The Study of Uncertainties in Physical Measurements, John R. Taylor - Univ. Science Books

## Unit III

### Linear Differential Equations and Special Functions (20 hrs)

3.1 Linear ordinary differential equations of first & second order 3.2 Gamma and Beta Functions (review of properties) 3.3 Dirac delta function – its property and integral forms 3.4 Bessel's differential equations 3.5 Legendre differential equations 3.6 Hermite differential equation 3.7 Laguerre differential equation Generating Functions – recurrence relation – orthogonality – Rodrigue's formula (to be discussed for all equations).

### **Text Books**

1. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber  
4th Edition, Academic Press
2. Mathematical Physics, B.S Rajput, Pragati Prakashan

### **Unit IV**

#### **Tensors (16 hrs)**

4.1 Tensor analysis - Coordinate transformations 4.1.1 Rank of a tensor, Classification of tensors 4.2 Addition, Subtraction 4.3 Outer product, Inner product and Contraction 4.3.1 Symmetric and antisymmetric tensors 4.4 Quotient law 4.5 Metric tensor - Conjugate tensor 4.5.1 Levi-Civita symbol - Kronecker delta function 4.6 Associated tensors - Raising and lowering of indices – geodesic 4.7 The Christoffel symbols and their transformation laws 4.7.1 Covariant derivative of tensors.

### **Text Books**

1. Introduction to Mathematical Physics, Charlie Harper, PHI
2. Vector analysis and tensors, Schaum's outline series, M.R. Spiegel, Seymour Lipschutz, Dennis Spellman, McGraw Hill
3. Mathematical Physics, B.S. Rajput, Y. Prakash 9th Ed, Pragati Prakashan
4. Tensor Calculus: Theory and problems, A. N. Srivastava, Universities Press
5. Matrices and Tensors in Physics – A W Joshi

### **Reference Books:**

1. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber 4<sup>th</sup> Edition, Academic Press
2. Mathematical Physics, B.D. Gupta, Vikas Pub. House, New Delhi
3. Advanced Engineering Mathematics, E. Kreyszig, 7th Ed., John Wiley
4. Introduction to mathematical methods in physics, G. Fletcher, Tata McGraw Hill
5. Advanced engineering mathematics, C.R. Wylie, & L C Barrett, Tata McGraw Hill
6. Advanced Mathematics for Engineering and Physics, L.A. Pipes & L.R. Harvill, Tata McGraw Hill
7. Mathematical Methods in Physics, J. Mathew & R.L. Walker, India Book House.
8. Mathematical Physics, H.K. Dass, S. Chand & Co. New Delhi.

# PH020102: BASIC QUANTUM MECHANICS

**Credit-4 (72 hours)**

**Objective of the course:** After studying the course, the student will (i) understand the fundamental concepts of quantum mechanics-operator formalism-Bra, Ket-representation –wave functions - and be able to apply them to various problems,(ii) understand the physics of time evolution and different pictures in quantum mechanics,(iii) understand not only the concept of angular momentum and its addition but also the rotation operator and its significance,(iv) understand the concept of perturbation and get ideas of different approximation methods –WKB method, Variation method etc. This course aims to give a brief introduction to Dirac's approach to quantum mechanics, operator formalism and its applications.

## Unit I

### Fundamental Concepts (16 hrs)

1.1 The Stern - Gerlach experiment- Dirac notation for state vectors- Ket space, bra space, Hilbert Space 1.2 Algebraic manipulation of operators – unitary operators & Hermitian operators-Eigenkets and eigenvalues – concept of complete set. 1.3 Matrix representation of operators, kets & Bras- Expectation values, Measurements, Observables - Generalized uncertainty relation 1.4 Change of basis – Transformation Operator, transformation matrix, unitary equivalent observables 1.5 Position, Momentum and Translation-Infinitesimal translation operator and its properties 1.6 Wave functions in position space and momentum space - Relations between operator formalism and wave function formalism 1.7 Gaussian wave packet –Computation of expectation values  $x$ ,  $x^2$ ,  $p$  and  $p^2$

### Text Book

1. Modern Quantum Mechanics, J. J. Sakurai, Pearson Education (Chapter 1)

## Unit II

### Time Evolution and Pictures of Quantum Mechanics (18 hrs)

2.1 Time evolution operator and its properties 2.1.1 Schrodinger equation for the time evolution operator 2.1.2 Energy eigenkets - Time dependence of expectation values 2.2 Time energy uncertainty relation 2.3 Schrodinger picture and Heisenberg picture 2.3.1 Behaviour of state kets and observables in Schrodinger picture and Heisenberg

picture 2.3.2 Heisenberg equation of motion- Ehrenfest's theorem 2.4 Time evolution of base kets - Transition amplitude 2.5 Energy eigenket and eigen values of a simple harmonic oscillator using creation and annihilation operators-Time development of the Oscillator

### **Text Book**

1. Modern Quantum Mechanics, J.J. Sakurai, Pearson Education(Chapter 2)

### **Unit III**

#### **Angular momentum (18 hrs)**

3.1 Infinitesimal rotations in quantum mechanics 3.1.1 Representation of the rotation operator - Rotation matrix 3.1.2 Properties of the rotation matrix - Orbital angular momentum as a rotation generator 3.2 Fundamental commutation relations of angular momentum 3.2.1 Commutation relations for  $J^2$ ,  $J_z$  - Eigenvalues of  $J^2$  and  $J_z$  - Matrix elements of angular momentum operators 3.3 Rotation operator for spin  $\frac{1}{2}$  system - Pauli two component formalism - Pauli spin matrices 3.4 Addition of angular momentum-Computation of Clebsch-Gordon coefficients

### **Text Book**

1. Modern Quantum Mechanics, J.J. Sakurai, Pearson Education

### **Unit IV**

#### **Perturbation Theory (7 hrs)**

4.1 Nondegenerate Energy levels - First and second order corrections in energy and wave function - Anharmonic oscillator 4.1.1 Degenerate Energy levels - First order correction-the ground state of Helium 4.2 First order Stark effect 4.3 Zeeman effect in Hydrogen atom

#### **The Variation Method (6 hrs)**

4.4 The variational principle-Rayleigh-Ritz method 4.4.1 Applications-The ground state of Helium and Hydrogen molecule ion

#### **WKB Approximation (7 hrs)**

4.5 The WKB method - The connection formula (proof not needed) - validity of WKB method 4.6 Barrier penetration-Alpha Emission

### **Text Book**

1. Quantum Mechanics, G Aruldas, PHI, 2002, (Chapter 9, 10, 11)

### **Reference Books:**

1. A Modern approach to quantum mechanics, John S. Townsend, Viva Books MGH.
2. Basic Quantum Mechanics, A. Ghatak, Macmillan India 1996
3. Quantum Mechanics, an Introduction, W Greiner, Springer Verlag
4. Quantum Mechanics, E. Merzbacher, John Wiley, 1996
5. Introduction to Quantum Mechanics, D.J. Griffiths, Pearson.
6. Quantum Mechanics, L.I. Schiff, Tata McGraw Hill
7. A Text Book of Quantum Mechanics, P.M. Mathews & K. Venkatesan, TMGH.
8. Quantum Mechanics, Concepts and Applications, N. Zettily, John Wiley & Sons.
9. Fundamentals of Quantum Mechanics Y.R. Waghmare, S Chand & Co.
10. Advanced Quantum Mechanics, Satya Prakash. KedarNathRamnath Publications.

## **PH020103: CONDENSED MATTER PHYSICS**

**Credit-4 (72 hours)**

**Objective of the course:** The objectives of this subject are to challenge the students to expand their knowledge of condensed matter physics and provide a foundation for further advanced studies. To develop a deep understanding of how condensed matter is characterised on the atomic scale. To broaden their appreciation of how condensed matter physics integrates into the discipline of physics overall. To understand the systems and acquire a fundamental understanding of a range of physical phenomena in condensed matter systems. Also to understand the phenomenon of superconductivity and their relation with the magnetic properties of materials.

### **Unit I**

#### **Lattice Vibrations and Thermal properties of Solids (16 hrs)**

1.1 Phonons - Quantization of lattice vibrations - Vibrations of monatomic and diatomic lattices - acoustic and optical modes 1.2 Phonon Momentum - Inelastic scattering of neutrons by phonons 1.3 Anharmonic crystal Interactions - Thermal Expansion 1.4 Lattice Heat Capacity 1.4.1 Einstein model - Density of modes in one and three dimensions 1.4.2 Debye model of lattice heat capacity – Debye's  $T^3$  law 1.5 Thermal conductivity of solids - Thermal resistance of solids - N process – U process.

### **Text books**

1. Solid State Physics-Structure and Properties of materials, M.A.Wahab. Narosa.
2. Solid State Physics, A.J.Dekker, Macmillan, 1967
3. Solid State Physics-J.S. Blakemore, Cambridge University Press.

## **Unit II**

### **Free Electron Theory (8 hrs)**

2.1 Energy levels and density of states in one dimension - Free electron gas in three dimensions 2.2 F D Statistics 2.3 Heat capacity of the electron gas 2.4 Electrical conductivity of metals and Ohm's law 2.4.1 Thermal conductivity of metals - Wiedemann-Franz law 2.4 Motion of electrons in Electric and magnetic fields - Hall effect.

### **Band Theory of Solids (16 hrs)**

2.5 Effective mass of electron 2.6 Bloch theorem - Kronig-Penney model 2.7 Brillouin zone construction in one and two dimensions – extended, reduced and periodic zone scheme of Brillouin zone 2.8 Nearly free electron model- Tight binding Approximation- OPW method- Pseudopotential method 2.9 Construction of Fermi surfaces 2.10 Experimental study of Fermi surfaces-Anomalous skin effect, cyclotron resonance, de Hass-Van Alphen Effect.

### **Text books**

1. Solid State Physics-Structure and Properties of materials, M.A.Wahab. Narosa.
2. Solid State Physics, A.J.Dekker, Macmillan, 1967

## **Unit III**

### **Dielectrics and Ferroelectrics (8 hrs)**

3.1 Theory of Dielectrics: Polarisation - Dielectric constant - Local Electric field -

Dielectric polarisability 3.1.1 Polarisation from dipole orientation - Dielectric losses  
 3.2 Ferroelectric crystals 3.2.1 Landau theory of ferroelectric phase transitions 3.2.2  
 Ferroelectric domain 3.3 Antiferroelectricity 3.4. Piezoelectricity - Applications of  
 Piezoelectric Crystals.

### **Superconductivity (10 hrs)**

3.5 Sources of super conductivity 3.5.1 The Meissner Effect-Heat capacity- Energy  
 gap - Isotope effect 3.5.2 Free energy of superconductor in magnetic field and the  
 stabilization energy 3.5.3 London equation and penetration of magnetic field 3.6  
 Cooper pairs and the BCS ground state 3.7 Flux quantization 3.8 Single particle  
 tunneling 3.8.1 DC and AC Josephson effects 3.9 High T<sub>c</sub> superconductors -  
 Applications of Superconductivity.

### **Text books**

1. Solid State Physics-Structure and Properties of materials, M.A.Wahab.Narosa.
2. Solid State Physics, S.O.Pillai, New Age International 6<sup>th</sup> Edn. 2010

### **Unit IV**

### **Magnetic properties (14 hrs)**

4.1 Diamagnetism and Para magnetism 4.1.1 Langevin's diamagnetism 4.2 Cooling  
 by adiabatic Demagnetization 4.3 Quantum theory of paramagnetism - Hund's rule  
 4.3.1 Paramagnetic susceptibility of conduction electrons 4.4 Ferro, Anti and Ferri  
 magnetism: Curie point and the exchange integral 4.4.1 Ferrimagnetic order - Curie  
 temperature and susceptibility of ferrimagnets 4.5 Antiferromagnetic order - Weiss  
 theory of ferromagnetism - Ferromagnetic domains.

### **Text books**

1. Solid State Physics-Structure and Properties of materials, M.A.Wahab.Narosa.
2. Solid State Physics, S.O.Pillai, New Age International 6<sup>th</sup> Edn. 2010

### **Reference Books:**

1. Introduction to Theory of Solids, H.M. Rosenberg, Prentice Hall
2. Solid State Physics, N.W.Ashcroft and N.D. Mermin, CengageLearning Pub.
3. Elements of Solid State Physics, J.P. Srivastava, Prentice Hall of India (2nd  
 Edition)
4. Solid State Physics-J.S. Blakemore, Cambridge University Press.
5. Solid State Physics, Gupta Kumar, Pragati Prakasan
6. Introduction to Solid State Physics, C. Kittel, Wiley Eastern.
7. Elementary Solid State Physics, M. Ali Omar, Pearson.

# PH020104: CLASSICAL MECHANICS AND RELATIVITY

**Credit-3 (54 hours)**

**Objective of the course:** After completing the course, the student will (1) understand the fundamental concepts of the Lagrangian and the Hamiltonian methods and be able to apply them to various problems, learn Hamilton-Jacobi method and the concept of action- angle variables. (2) Understand the physics of small oscillation and the concepts of canonical transformations and Poisson brackets, (3) understand the basic ideas of rigid body dynamics, (4) This course also provide the basic ideas of special and general theory of relativity , non-linear dynamics and chaos.

## Unit I

### Lagrangian and Hamiltonian Methods (18 hrs)

1.1 Review of Lagrangian dynamics-Applications of Lagrange's equations- Velocity dependent potentials 1.2 Hamilton's equations of motion -Cyclic coordinates  
- Symmetry and conservation theorems 1.3 Variational principle and Hamilton's equations - Physical significance of principle of least action –Proof1.4 Canonical transformations 1.4.1 Equation of canonical transformation-example of canonical transformation-harmonic Oscillator 1.5 Lagrange brackets- Poisson brackets – Equation of motion in Poisson bracket form – Canonical invariance of poisson bracket 1.6 Hamilton's characteristic function 1.7 Hamilton Jacobi theory – Harmonic Oscillator- Kepler Problem-1.8 Action angle variables – Harmonic Oscillator- Kepler problem.

### Text books

1. Classical Mechanics, J C Upadhyaya
2. Classical Mechanics , G Aruldas
3. Classical Mechanics , H.Goldstein

## Unit II

### Rigid Body Dynamics (18 hrs)

2.1 Independent Coordinates 2.2 Euler's Angles- Euler's equation of motion 2.3 Infinitesimal rotation – Rate of change of a vector 2.4 Force free motion of a symmetric top - Heavy Symmetric top 2.5 Coriolis Force and its effects. 2.6 Theory of Small Oscillations -Formulation of the problem – Eigen value equation - Normal coordinates- normal modes- Two coupled oscillators -Oscillations of linear triatomic molecules

### **Text books**

1. Classical Mechanics, J C Upadhyaya
2. Classical Mechanics , G Aruldas
3. Classical Mechanics , H.Goldstein

### **Unit III**

#### **Special and General Theory of relativity (18 hrs)**

3.1 The postulates of Special Theory of relativity 3.2 Relativistic kinematics and mass–energy equivalence 3.3 Relativistic Lagrangian and Hamiltonian of a particle- Lorentz co-variance 3.4 Four vectors - Invariance of Maxwell's equations under Lorentz transformations 3.5 General theory of relativity-Principle of Equivalence- space curvature-Gravitational red shift. 3.6 Nonlinear dynamics and introduction to chaos - Linear and Nonlinear systems 3.6.1 Phase space dynamics-Bifurcation-logistic map- Attractors-Universality of chaos-Fractals (Qualitative ideas only).

### **Text book**

1. Classical Mechanics, G Aruldas

### **Reference Books:**

1. Classical mechanics, N. C. Rana & P.S. Joag - TMGH.
2. Classical mechanics, Satyaprakash, Sultan Chand & Company.
3. Classical mechanics, Gupta & Kumar, Pragati Prakasan.
4. Classical Mechanics, A.K. Raychauduri, Oxford Univ. Press

### **PH020105: GENERAL PHYSICS PRACTICALS**

#### **Credit-4 (180 hours)**

*(Minimum of 12 Experiments with Error analysis of the experiment is to be done)*

1. Magnetic susceptibility - Quincke's method
2. Magnetic susceptibility - Guoys method
3.  $Y, n, \sigma$  Cornu's method, (a) Elliptical fringes
4.  $Y, n, \sigma$  Cornu's method, (b) Hyperbolic fringes
5. Young's modulus and Poisson's ratio – Koenig's method

6. Michelson interferometer –  $\lambda$  and  $d\lambda$ / thickness of mica
7. Absorption spectrum- $\text{KMnO}_4$  solution- telescope and scale arrangement- Hartmann's formula
8.  $e/m$  of electron – Thomson's method
9. Thermistor characteristics
10. Determination of  $e/k$  – silicon transistor
11. Hydrogen spectrum – Rydberg constant
12. Ultrasonic – Acousto-optic technique- elastic property of a liquid.
13. Oscillating disc – viscosity of liquid
14. Determination of  $e$  – Milliken's method
15. Characteristics of a photodiode
16. B-H curve – Anchor ring
17. Mutual inductance – Carey Foster's bridge
18. Self and mutual inductance – Anderson's bridge
19. Arc spectrum of Iron, Copper and Brass
20. Absorption spectrum of Iodine- photographic method
21. Raman effect in liquids – plate measurement
22. Identification of elements by spectroscopic method
23. Dielectric constant of a non-polar liquid
24. Temperature dependence of a ceramic capacitor and verification of Curie Weiss law
25. Electrical and thermal conductivity of copper and determination of Lorentz Number
26. Silicon diode as temperature sensor Verification of stephan's law and determination of Stephan's constant of Radiation
27. Diffraction of light by cross wire and wire mesh using laser.

28. Diffraction of light by double slit and grating using laser.
29. Cauchy's constant of liquid and liquid mixture using holoprism and spectrometer.
30. Surface tension of a liquid using Jaegger's method.
31. Characteristics of a phototransistor.
32. I-V characteristics of LED and LDR circuits.
33. Wavelength of He-Ne Laser using Vernier Calipers.
34. Identification of Fraunhofer lines in solar spectrum.

## SEMESTER – II

### PH020201: APPLIED MATHEMATICS FOR PHYSICS – II

**Credit-4 (72 hours)**

**Objective of the course:** The purpose of the course is to introduce students to methods of mathematical physics and to develop required mathematical skills to solve problems in quantum mechanics, electrodynamics and other fields of theoretical physics. The first objective of this course is to develop students' facility with certain mathematical techniques. The second objective is to highlight applications of mathematical methods to physical systems. Applications shed light on both the mathematics and the logic underpinning physical models. This allows students to develop valuable intuition for subsequent courses where these same methods will be applied.

#### Unit I

##### Functions of Complex Variables and Analysis (20 hrs)

1.1 Introduction to complex variable - Analytic functions 1.2 Cauchy–Riemann equations - C-R equation in polar form 1.3 Cauchy's Integral Theorem - Cauchy's theorem for multiply connected domains 1.3.1 Cauchy's integral formula 1.3.2 Derivatives of analytic functions 1.4 Taylor & Laurent expansion 1.5 Singularities – Poles - Residue theorem 1.6 Evaluation of definite integrals

##### Text Books

1. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber 4<sup>th</sup> Edition, Academic Press.
2. Mathematical Physics, H.K. Dass and Dr. Rama Verma, S. Chand & Company Ltd., New Delhi.
3. Higher Engineering Mathematics- Dr. B.S. Grewal- 42<sup>nd</sup> Edn.-Khanna Pub.-New Delhi

#### Unit II

##### Elements of Abstract Algebra (18 hrs)

2.1 Introductory definitions and concepts - cyclic groups 2.2 groups of transformations- multiplication table-point groups 2.3 Reducible and irreducible

representations 2.4 Schur's lemmas and Orthogonality theorem 2.5 Group character table 2.5.1 Applications in molecular and crystal physics 2.6 Lie group and lie algebra 2.6.1 3D rotational group 2.6.2 Poincare and Lorentz group 2.7 SU(2) and SU(3) groups.

### **Text Books**

1. Elements of Group Theory for Physicists, A.W. Joshi, New Age India
2. Mathematical Physics with Classical mechanics-SatyaPrakash, SultanChand& Sons, New Delhi.
3. Group theory- Schaum's series, Benjamin Baumslag& Bruce Chandler, MGH.

### **Unit III**

#### **Fourier transforms and Fourier series (9 hrs)**

3.1 Fourier transforms- Fourier Cosine and Sine Transform 3.1.1 Fourier Transform of Gaussian function - finite wave train 3.1.2 Momentum representation for hydrogen atom ground state & harmonic oscillator 3.4 Fourier Series – Fourier series of square wave - full wave rectifier.

#### **Laplace Transforms (9 hrs)**

3.5 Introduction to Laplace Transform 3.6 Inverse Laplace Transform 3.7 Solution of differential equation 3.7.1 L T Earth's mutation, LCR circuit, Driven oscillator with damping

### **Text Books**

1. Mathematical Methods for Physicists, G.B. Arfken&H.J. Weber 4th Edition, Academic Press.
2. Mathematical Physics, H.K Dass&Dr. Rama Verma, S. Chand &Co.

### **Unit IV**

#### **Partial Differential Equations and Green's Functions (16 hrs)**

4.1 Partial differential equation – characteristics - boundary conditions 4.2 classes of partial differential equations- Heat equation, Laplace's equation, Wave equation 4.3 Non-linear partial differential equation and boundary conditions 4.4 Separation of variables in Cartesian, circular cylindrical and spherical polar coordinates 4.5 Non

homogeneous equation - Green's function 4.6 Symmetry of Green's functions-Forms of Green functions 4.6.1 Poisson's equation.

### **Text Books**

1. Mathematical Methods for Physicists, G.B. Arfken & H.J. Weber, 4<sup>th</sup> Edition, Academic Press.
2. Mathematical Physics with Classical mechanics-SatyaPrakash, SultanChand & Sons, New Delhi.
3. Mathematical Physics, B.S Rajput, PragatiPrakashan.

### **Reference Books:**

1. Introduction to mathematical methods in physics, G.Fletcher, Tata McGraw Hill
2. Advanced engineering mathematics, C.R. Wylie, & L C Barrett, Tata McGraw Hill
3. Advanced Mathematics for Engineering and Physics, L.A. Pipes & L.R. Harvill, Tata McGrawHill.
4. Mathematical Methods in Physics, J. Mathew & R.L. Walker, India Book House.
5. Introduction to Mathematical Physics, Charlie Harper, PHI
6. Vector analysis and tensors, Schaum's outline series, M.R. Spiegel, Seymour Lipschutz, Dennis Spellman, McGraw Hill

## **PH020202: ELECTRODYNAMICS AND ELECTROMAGNETIC WAVES**

**Credit-4 (72 hours)**

**Objective of the course:** To apprise the students regarding the concept of electrodynamics and Maxwell's equations and use them in various situations. At the end of the course, the learner should be able to (i) explain the use of Maxwell's equations in analysing the electromagnetic field due to time varying charge and current distribution (ii) describe the nature of electromagnetic waves and its propagation through different media and interfaces (iii) acquire knowledge of principles of relativistic electrodynamics (iv) discuss radiation from localized time varying electromagnetic sources.

## Unit I

### Electrostatics, Magnetostatics and Electrodynamics (18 hrs)

1.1 Laplace's Equation – in one, two, three dimensions and its solutions. 1.2 Boundary conditions and Uniqueness theorems - Conductors and the second Uniqueness theorem. 1.3 Multipole expansion - Approximate Potentials at large distances - The Monopole and Dipole terms - Origin of coordinates in Multipole expansions - The electric field of a dipole. 1.4 Magnetostatics- Divergence and curl of B- Magnetic vector potential - Magnetostatic boundary conditions-1.5 Multipole expansion of the vector potential - The auxiliary field H -Ampere's law in magnetized materials 1.6 Maxwell's Equations - Maxwell's equations in matter 1.6.1 Poynting's theorem 1.6.2 Maxwell's StressTensor

#### Text Book

1. Introduction to Electrodynamics, David J Griffiths, PHI Learning, 2009 (Chapter 3,5,8)

## Unit II

### Electromagnetic Waves and Wave guides (18 hrs)

2.1 Electromagnetic Waves - Waves in one dimension 2.1.1 Electromagnetic waves in vacuum 2.1.2 Electromagnetic waves in matter 2.2 Reflection and transmission at normal incidence - Reflection and transmission at oblique incidence 2.3 Absorption and Dispersion 2.4 Guided waves – waves between parallel conducting plane TE, TM and TEM waves 2.4.1 TE and TM Waves in Rectangular wave guides 2.4.2 The coaxial transmission lines

#### Text Book

1. Introduction to Electrodynamics, David J Griffiths, PHI Learning, 2009

## Unit III

### Relativistic Electrodynamics (20 hrs)

3.1 Relativistic Mechanics - Proper time and velocity-Relativistic energy and Momentum 3.2 Relativistic Kinematics 3.2.1 Two-body scattering 3.2.2 Decay of a particle 3.3 Relativistic dynamics. 3.4 Relativistic Electrodynamics - Magnetism as a relativistic phenomenon 3.4.1 Transformation of the fields 3.4.2 Electromagnetic field

tensor 3.4.3 Electrodynamics in tensor notation 3.4.4 Potential formulation of relativistic electrodynamics.

### **Text Book**

1. Introduction to Electrodynamics, David J Griffiths, PHI Learning, 2009 (Chapter 12)

### **Unit IV**

#### **Radiation (16 hrs)**

4.1 Potentials and Fields -The Potential formulation - Continuous Distributions 4.2 Retarded Potentials – Jefimenko's equations 4.3 Point Charges - Lienard-Wichert Potentials. 4.4 Dipole radiation 4.4.1 Electric dipole radiation 4.4.2 Magnetic dipole radiation 4.4.3 Radiation from an arbitrary source. 4.4.4 Point Charges - Power radiated from a point charge.

### **Text Book**

1. Introduction to Electrodynamics, David J Griffiths, PHI Learning.

### **Reference Books:**

1. Classical Electrodynamics, J.D. Jackson 3rd Ed. Wiley, 1993.
2. Introduction to Classical Electrodynamics, Y K Lim, World Scientific, 1986.
3. Electromagnetic waves and radiating systems, E.C. Jordan & K. G. Balmain PHI, 1968
4. Electromagnetic fields, S. Sivanagaraju, C. Srinivasa Rao, New Age International.
5. Electromagnetic Waves and Fields, V. V. Sarwate, Wiley Eastern Ltd, New Age International
6. The Feynman Lectures in Physics, Vol. 2, R. P. Feynman, R.b. Leighton & M. Sands

# **PH020203: ADVANCED ELECTRONICS AND COMMUNICATION**

**Credit-4 (72 hours)**

**Objective of the course:** To apprise the students regarding the concept of advanced electronics and communication. At the end of the course, the learner should be able to (i) explain the use of special semiconductor devices and different types of negative feedback characteristics. (ii) Describe the nature of practical op-amp and frequency response of an op-amp. (iii) Acquire knowledge of signal processing and communications (iv) discuss various types of active filters and oscillators.

## **Unit I**

### **Special Semiconductor Devices (8hrs)**

1.1 Review of Bipolar junction Transistor (BJT) biasing and characteristics- FET, JFET  
1.2 Structure and working, I/V Characteristics under different conditions, biasing circuits  
1.3 MOSFET: Depletion and Enhancement type MOSFET

### **Signal processing and Communication Systems (10hrs)**

1.4 Modulation-Amplitude modulation - Frequency spectrum of AM- Representation of AM - Power relation in AM  
1.5 Single Side Band: Evolution, Balanced modulator  
1.6 Theory of frequency and Phase modulation, Generation of frequency modulation  
1.7 Pulse communications - Pulse amplitude modulation- Pulse width, Pulse position, Pulse code modulations.  
1.8 Multiplexing techniques: Frequency division and time division multiplexing.

### **Text Book**

1. Basic Electronics solid state, B.L Theraja, S (2005) Chand and company.
2. Electronic communication systems: Kennedy and Davis (4 Edn).

## **Unit II**

### **Negative Feedback Op-amp Characteristics (12 hrs)**

2.1 Differential Amplifier 2.1.1 Inverting Amplifier-Non Inverting Amplifier-Block Diagram Representations  
2.2 Voltage series feedback: Closed loop voltage gain, Difference Input voltage ideally zero-Input and output resistance with feedback- Band width with feedback – Total output offset voltage with feedback  
2.3 Voltage

follower 2.4 Voltage shunt feed back amplifier: Closed loop voltage gain –Inverting input terminal at virtual ground- Input and output resistance with feedback-Band width with feed back- Total output offset voltage with feed back 2.5Current to voltage converter, Inverter 2.6 Differential amplifier with one Op-amp and two Op-amps.

### **The Practical Op-amp(6 hrs)**

2.7 Input off set voltage, Input bias current, Input off set current-Total output offset voltage 2.8 Thermal drift- Effect of variation in power supply voltages on offset voltage 2.10 Change in input offset voltage and input off set current with time -Noise, Common mode configuration and CMRR.

### **Text Book**

Op-amps and linear integrated circuits: R.A.Gayakwad.

### **Unit III**

#### **General Linear Application (with design)(12hrs)**

3.1 DC and AC amplifiers, AC amplifier with supply voltage 3.2 Peaking Amplifier 3.3 Summing, Scaling and averaging amplifiers 3.4 Instrumentation Amplifiers using transducer bridge 3.5 Differential input and differential output amplifier, Low voltage DC and AC voltmeter 3.6 Voltage to current converter with grounded load, Current to voltage converter, Very high input impedance circuit 3.7 Integrator and differentiator

#### **Frequency Response of an Op-amp(6 hrs)**

4.1 Frequency response 3.9 Compensating networks, Frequency response of internally compensated and non- compensated Op-amps 3.10 High frequency op-amp equivalent circuit 3.11 Open loop gain as a function of frequency 3.12 Closed loop frequency response 3.13 Circuit stability, Slew rate.

### **Text Book**

Op-amps and linear integrated circuits: R.A.Gayakwad.

### **Unit IV**

#### **Active Filters and Oscillators (with design)(12 hrs)**

4.1 Active filters 4.1.2 First order and second order low pass Butterworth filter

4.1.3 First order and second order high pass Butterworth filter

4.1.4 Wide and

narrow band pass filter 4.1.5 Wide and narrow band reject filter 4.1.6 All passfilter,  
4.2 Oscillators 4.2.1 Phase shift and Wienbridge oscillators 4.3 Square, triangular and  
saw-tooth wave generators 4.4 Voltage controlled oscillator.

### **Comparators and IC555 Timer (6 hrs)**

4.5 Basic comparators 4.5.1 Zero crossing detector 4.5.2 Schmitt Trigger 4.5.3  
Comparator characteristics 4.5.4 Limitations of Op-amps & comparators  
4.6 IC555 Internal architecture 4.6.1 Applications IC555 PLL 4.7 Voltage regulator  
IC 4.7.1 Fixed Voltage regulator.

### **Text Book**

Op-amps and linear integrated circuits: R.A.Gayakwad.

### **Reference Books:**

1. Electronic Principles Albert P. Malvino, David J Bates, McGraw-Hill Companies
2. Introduction to Semiconductor Devices by M.S. Tyagi, John Wiley & Sons
3. Electronic Principles Albert P. Malvino, David J Bates, McGraw-Hill Companies
4. L.Floyd, Electronic Devices, "Pearson Education" New York (2004)
5. Power Electronics, V. Subrahmanyam, 2nd Edition, 2006
6. Electronic Communications: Dennis Roddy and John Coolen 4<sup>th</sup> Edn Pearson.
7. A textbook of Applied Electronics, R.S.Sedha, S.Chand & Co.
8. Principles of Electronics, V.K.Mehta and Rohit Mehta S.Chand & Co.

## **PH020204: ADVANCED NUCLEAR PHYSICS**

### **Credit-4 (54 hours)**

**Objective of the course:** After completing this syllabus the student will (a) have an understanding of the nuclear structure and the decay processes, they will also have an understanding of different nuclear models. (b) be able to understand different nuclear interactions including fission and fusion, they will also get an idea about the recent developments in controlled fission and fusion reactions (c) have an idea about the families of elementary particles and the fundamental interactions governing them.

### **Unit I**

## **Nuclear Structure and Decay (18 hrs)**

1.1 Basic properties of nuclei, Masses and relative abundances 1.2 Mass defect - size and shape, nuclear binding energy 1.2.1 Nuclear stability - nuclear angular momentum and parity 1.3 Nuclear electromagnetic moments 1.3.1 Magnetic dipole moment and electric quadrupole moments 1.4 Liquid drop model – Semi empirical mass formula of Weizacker 1.5 Shell model - Shell model potential –1.5.1 Magic numbers - Valence nucleons 1.6 Beta decay - energy release 1.7 Fermi theory - experimental tests 1.7.1 Angular momentum and parity selection rules

### **Text Books**

1. Introductory Nuclear Physics, K. S. Krane Wiley
2. Nuclear Physics, D. C. Tayal, Himalaya Publishing House
3. Nuclear Physics(2<sup>nd</sup> Edition) , S N Ghoshal, S Chand & Company

## **Unit II**

### **Nuclear Interactions, Fission and Fusion (18 hrs)**

2.1 Nuclear forces, Characteristics of nuclear force 2.1.1 Spin dependence, charge independence, charge symmetry 2.2 Two body problem - Ground state of deuteron 2.3 Types of nuclear reactions and conservation laws 2.3.1 Compound-nucleus reactions - heavy ion reactions 2.4 Characteristics of fission - energy in fission 2.4.1 Fission and nuclear structure 2.5 Controlled fission reactions - Fission reactors 2.6 Fusion processes, Characteristics of fusion 2.7 Controlled fusion reactor, ITER.

### **Text Books**

1. Introductory Nuclear Physics, K. S. Krane Wiley
2. Nuclear Physics, D. C. Tayal, Himalaya Publishing House
3. Nuclear Physics(2<sup>nd</sup> Edition) , S N Ghoshal, S Chand & Company

## **Unit III**

### **Particle Physics (18 hrs)**

3.1 Types of interactions between elementary particles 3.2 Hadrons and leptons - Masses, spin, parity and decay structure 3.3 Quark model-Confined quarks - coloured quarks, Gluons, Higg's Boson Gell-Mann- Nishijima formula 3.4 symmetries and

conservation laws 3.4.1 C, P and T invariance 3.5 Applications of symmetry arguments to particle reactions 3.6 Parity non-conservation in weak interactions 3.7 Grand unified theories (Qualitative ideas), LHC (Elementary ideas).

### **Text Books**

1. Introduction to Elementary Particle, D.J. Griffiths, Harper and Row, NY, (1987)
2. Nuclear Physics, D. C. Tayal, Himalaya Publishing House
3. Nuclear Physics(2<sup>nd</sup> Edition) , S N Ghoshal, S Chand & Company

### **Reference Books**

1. Nuclear Physics, R.R. Roy and B.P. Nigam, New Age International, New Delhi,(1983).
2. The particle Hunters - Yuval Ne'eman & Yoram Kirsh CUP, (1996)
3. Concepts of Nuclear Physics, B.L. Cohen, TMH, New Delhi, (1971).
4. Theory of Nuclear Structure, M.K. Pal, East-West, Chennai, (1982).
5. Atomic Nucleus, R.D. Evans, McGraw-Hill, New York.
6. Nuclear Physics, I. Kaplan, 2nd Edn, Narosa, New Delhi, (1989).

### **Advanced Reading**

1. Introduction to Nuclear Physics, H.A. Enge, Addison Wesley, London, (1975).
2. Introductory Nuclear Physics, Y.R. Waghmare, Oxford-IBH, New Delhi, (1981).
3. Atomic and Nuclear Physics, Ghoshal, Vol. 2, S. Chand & Company
4. Fundamentals of Elementary Particle Physics, J.M. Longo, MGH, New York, (1971).
5. Nuclear and Particle Physics, W.E. Burcham and M. Jobes, Addison-Wesley, Tokyo, (1995).

## PH020205: ELECTRONICS PRACTICALS

### Credit-4 (180 hours)

*(Minimum of 12 Experiments should be done)*

1. RC coupled CE amplifier – two stages with feedback – frequency response and voltage gain
2. Differential amplifier – using transistors – constant current source – frequency response
3. Active filters – low pass and high pass – first and second orders – frequency response and roll off rate
4. Band pass filter using single op-amp
5. Voltage controlled oscillator using transistors
6. Voltage regulation using op-amp with short circuit protection
7. UJT characteristics
8. Relaxation oscillator using UJT
9. Characteristics of SCR
10. RF amplifier- frequency response and band width
11. Op-amp monostable multivibrator, square wave generator
12. IC 555 monostable multivibrator and astable multivibrator
13. IC 555 pulse width modulation and linear RAMP generator
14. Voltage controlled oscillator using IC 555
15. Shift registers Binary sequence generator
16. Synchronous counters and divide by N counters
17. Op-amp mathematical operations
  - a) Summing amplifier
  - b) Differential amplifier
  - c) Zero Cross Detector
  - d) Op-amp as an integrator and differentiator.
18. Amplitude modulation using transistors
19. AM Modulator and Demodulator using MC1496
20. Precision rectifiers – measurement of rectifier efficiency at different frequencies
21. Op- amp triangular wave generator with specified amplitude
22. Op- amp sawtooth wave generator with specified amplitude

23. Analog to digital and digital to analog converter ADC0800 & DAC0800
24. RC phase shift Oscillator using op amp
25. Op-amp Wein bridge oscillator
26. Crystal Oscillator
27. Single stage CE amplifier design and study of frequency response.
28. Study of RC Phase shift Oscillator using transistors.
29. Study of Schmitt Trigger Circuits and calculation of Hysteresis voltage.
30. Emitter follower and Source follower circuits.
31. Frequency multiplier using PLL

## SEMESTER – III

### PH020301: STATISTICAL PHYSICS AND ASTROPHYSICS

**Credit-4 (72 hours)**

**Objective of the course:** The course is designed to give the students a firm understanding of statistical mechanics. The concept developed in classical system for various ensembles when applied to quantum systems have certain limitations, but classical results can be recovered from the quantum theories in the high temperature- low density limit. The theories deduced by Statistical Mechanics have been applied to Astro Physics. A fundamental study of Astro Physics along with structure and evolution of stars have been covered in this course.

#### Unit I

##### **Quantum Statistical Mechanics and Ideal Gas Systems (18 hrs)**

1.1 The postulates of Quantum statistical mechanics – in distinguishability of particles - exchange degeneracy 1.2 Density matrix - Ensembles in Quantum statistical mechanics - statistical distribution – The ideal gas in quantum mechanical micro canonical and other quantum mechanical ensemble 1.3 Partition functions and other thermodynamic quantities of monatomic and diatomic molecules 1.4 Thermodynamic behaviour of an ideal Fermi gas– Pauli Para magnetism 1.5 Thermodynamic behavior of a Bose gas – Bose Einstein condensation – 1.6 Theory of white dwarf stars.

##### **Text books**

1. Statistical Mechanics, Gupta, Kumar, Pragati Prakasan
2. Statistical mechanics, Kerson Huang, John Wiley and Sons

#### Unit II

##### **The Canonical and Grand Canonical Ensemble Fluctuations and Phase Transitions (18 hrs)**

2.1 Thermo dynamical relations in a canonical ensemble– energy fluctuations in the canonical ensemble: correspondence with micro canonical ensemble 2.2 Density and energy fluctuations in the grand canonical ensemble: correspondence with other ensembles. 2.3 One dimensional random walk problem – Brownian motion and Random walk- 2.4. Fokker Planck equation Phase transitions – First and second order phase

transition correlation functions 2.5 Bragg–Williams approximation – critical phenomena - critical exponents - scaling hypothesis 2.6 Ising model and its solution for a linear chain – 2.7 Equivalence of Ising model to other models - lattice gas and binary alloy- solution of one dimensional Ising model 2.8 Liquid Helium

### **Text books**

1. Statistical mechanics, R..K. Pathria, Butterworth-Heinemann
2. Statistical Mechanics, B.K. Agarwal and M. Eisner, Wiley Eastern

## **UNIT III**

### **Astrophysics (18hrs)**

3.1 The sun-internal structure-solar atmosphere-sun spots-solar flares-prominences  
3.2 celestial coordinate system-sun earth system –galactic system 3.3 Stellar spectrum-  
stellar types -Stellar magnitude sequence-Absolute magnitude and the distance modulus-  
Colour index of a star -Luminosities of a star 3.4 Measurement of distances and Absolute  
luminosities 3.5 measuring temperature- Application of Saha's Equation. 3.6 Virial  
theorem 3.7 stellar energy -Thermonuclear reactions in stars, pp chains and CNO cycle-  
Solar Neutrino problem- subsequent thermonuclear reactions nucleosynthesis

### **Text books**

- 1 Astrophysics: Stars and Galaxies, K D Abhyenkar, Universities Press.
- 2 Introduction to Astrophysics, Baidyanath Basu, PHI.
- 3 Textbook of astronomy an astrophysics with elements of cosmology, V.B.Bhatia,  
Narosa publishing house, 2001

## **UNIT IV**

### **Structure and Evolution of Stars (18hrs)**

4.1 Evolution of a star-Hertz Sprung Russell diagram 4.2 star formation - life of a star -  
stellar structure -final stages of stellar evolution 4.3 Newtonian theory of stellar  
equilibrium 4.4 White Dwarfs, Electron degeneracy and equation of States- Chandrasekhar  
Limit-Mass- Radius relation of WD 4.5 Neutron Stars, Mass-Radius relations of NS-  
Pulsars, Magnetars, Gamma ray bursts 4.6 Black holes, Collapse to a black hole, event  
horizon, singularity. 4.7 Qualitative discussions on galaxies, Nebulae, Quasars, Brown  
Dwarfs, Red giants, Nova, supernova.

### **Text books**

- 1 Astrophysics: Stars and Galaxies, K D Abhyenkar, Universities Press.

## 2 Introduction to Astrophysics, Baidyanath Basu, PHI.

### Reference Books:

1. Fundamentals of Statistical Mechanics, B. B. Laud, New Age International.
2. Elements of Statistical Mechanic, Kamal Singh, S P. Singh, S. Chand & Co.
3. Introduction to Statistical Mechanics, S.K. Sinha, Alpha Science International.
4. Statistical Mechanics, Tung Tsang, Rinton Press.
5. Introductory Statistical Mechanics, R. Bowley & M. Sanchez, 2nd Edn. Oxford University Press
6. The Structure of the Universe – J.V.Narlikar (OUP, 1978)
7. Fundamental Astronomy. H. Karttunen.P. Kröger.H. Oja.M. Poutanen .K. J. Donner (Eds.),Springer-Verlag Berlin Heidelberg New York
8. The Physical Universe. FrankShu. University Science Books
9. An Introduction to Modern Astrophysics. B.W. Carroll, D.A.Ostlie, Pearson

### PH020302: NUMERICAL METHODS IN PHYSICS

#### Credit-4 (72 hours)

**Objective of the course :** Apply numerical methods to obtain approximate solutions to mathematical problems. Derive numerical methods for various mathematical operations and tasks, such as interpolation, curve fitting, differentiation, integration, the solution of system of equations, the solution of ordinary and partial differential equations and to learn how to apply numerical methods to a variety of physical problems.

### Unit I

#### Interpolation (12 hrs)

1.1 Finite differences 1.1.1 Forward differences - Backward differences – Central differences 1.1.2 Introduction to finite difference operators 1.1.3 Detection of errors by use of difference tables 1.1.4. Differences of a polynomial 1.2 Interpolation - Errors in Polynomial Interpolation 1.2.1 Newton's formulae for interpolation – forward and backward interpolation formula 1.2.2 Central difference interpolation formulae - Gauss central difference formulae - Stirlings formulae-Evretts formula 1.2.3 Interpolation with unevenly spaced points-Lagrange's interpolation formulae- Error in Lagrange's interpolation formulae - Hermite's interpolation formulae

### **Text Books**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd. (Fifth Edition) Chapter – 3
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning Private Limited.( Third Edition) Chapter - 6
3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition) Chapters – 6,7

### **Curve fitting (6 hrs)**

1.3Least Squares Curve fitting procedures 1.3.1 Fitting a straight line 1.3.2 Linearization of Nonlinear laws - Curve fitting by polynomial.

### **Text Books**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd.( Fifth Edition) Chapter – 4
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning Private Limited.( Third Edition) Chapter - 5
3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition) Chapter – 5

## **Unit II**

### **Numerical Differentiation (6 hrs)**

- 2.1 Numerical differentiation 2.1.1Differentiation for tabular and non-tabular functions  
2.1.2 Errors in Numerical differentiation 2.1.3finding maxima and minima of a tabulated function

### **Numerical Integration (10 hrs)**

- 2.2 Numerical integration 2.2.1 Trapezoidal rule – error associated 2.2.2 Simpson's 1/3 rule – error associated 2.2.3 Simpson's 3/8 rule –error associated 2.3 Romberg Integration 2.4 Gaussian Integration 2.5 Double Integration 2.6 Monte Carlo evaluation of integrals –Newton – cotes integration formula

### **Text Books**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd.( Fifth Edition) Chapter – 6
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning

Private Limited.( Third Edition) Chapter - 7

3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition) Chapter – 8

### **Unit III**

#### **Numerical Solution of Ordinary Differential Equations (10 hrs)**

3.1 Euler method 3.2 modified Euler method and Runge - Kutta 4th order methods - adaptive step size R-K method 3.3 predictor - corrector methods - Milne's method, Adam - Mouton method.

#### **Text Books**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd. .( Fifth Edition) Chapter – 8
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning Private Limited.( Third Edition) Chapter - 8
3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition) Chapter – 10

#### **Numerical Solution of System of Equations (10 hrs)**

- 3.2 Gauss-Jordan elimination Method
- 3.3 Gauss-Seidel iteration method
- 3.4 Gauss elimination method
- 3.5 Gauss-Jordan method to find inverse of a matrix.
- 3.6 Power method and Jacobi's method to solve eigen value problems.

#### **Text Books**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd.( Fifth Edition) Chapter –7
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning Private Limited.( Third Edition) Chapter - 3
3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition) Chapter – 3

### **Unit IV**

#### **Numerical Solutions of partial differential equations (18 hrs)**

- 4.1 Boundary value problem and initial value problem - Cauchy's and Dirichlet

conditions – Classification of partial differential equation 4.2 Finite difference approximations to derivatives 4.3 Laplace equation 4.3.1 Iterative methods -Jacobi's method – Gauss Seidal method – Successive over relaxation- The ADI method 4.4 Parabolic equations – Heat conduction equation 4.4.1 Iterative methods for the solution of equations 4.5 Hyperbolic equations – Wave equations -Schmidt method – Crank – Nicolson method

### **Text Books**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd.( Fifth Edition) Chapter –9
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning Private Limited.( Third Edition) Chapter – 9
3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition) Chapter – 11

### **Reference Books:**

1. Introductory Methods of Numerical Analysis, S.S. Sastry, PHI Pvt. Ltd.( Fifth Edition)
2. Numerical methods for Scientists and Engineers – K Sankara Rao, PHI Learning Private Limited.( Third Edition)
3. Numerical Methods in Engineering & Science – Dr. B S Grewal, Khanna Publishers (10<sup>th</sup> Edition)
4. An Introduction to Computational Physics, Tao Pang, Cambridge University Press
5. Numerical methods for scientific and Engineering computation M.KJain,S.R.K Iyengar, R.K. Jain, New Age International Publishers
6. Computer Oriented Numerical Methods, V. Rajaraman, PHI, 2004.
7. Numerical Methods, E. Balagurusami, Tata McGraw Hill, 2009.
8. Numerical Mathematical Analysis, J.B. Scarborough, 4th Edn, 1958
9. Mathematical Methods, G. Shanker Rao, K. Keshava Reddy, I.K. International Publishing House, Pvt. Ltd.

## **PH020303: ADVANCED QUANTUM MECHANICS**

**Credit-4 (72 hours)**

**Objective of the course:** After studying the course, the student will (i) understand the fundamentals of time dependent perturbation theory and different types of approximations used, (ii) understand the concepts of scattering and be able to apply them to various problems, (iii) the concepts of relativistic quantum mechanics and its applications, (iv) understand not only the concept of classical and quantum field theories but also be able to quantize scalar and vector fields.

### **Unit I**

#### **Time Dependent Perturbation Theory (12 hrs)**

1.1 Time dependent potentials 1.1.1 Interaction picture -Comparison of pictures - Time evolution operator in interaction picture 1.2 Time dependent perturbation theory- Dyson series – transition probability 1.2.1 Constant perturbation – Fermi's Golden rule 1.2.2 Harmonic perturbation - interaction with classical radiation field - Transition rates for absorption and emission of radiation 1.2.3 Electric dipole approximation - Electric dipole selection rules 1.3 Photo electric effect – Energy shift and decay width.

#### **Text Book**

1. Modern Quantum Mechanics, J.J. Sakurai, Revised Edition (Chapter 5)

#### **Approximation Methods(4 hrs)**

1.4 Sudden approximation-Sudden reversal of magnetic field 1.5 Adiabatic approximation -Adiabatic reversal of magnetic field.

#### **Text Book**

1. Quantum mechanics – V. K. Thankappan New Age Int. Pub 1996 (Chapter 8)

### **Unit II**

#### **Scattering (18 hrs)**

2.1 Asymptotic equation for scattering 2.1.1 Scattering Amplitude and Differential Cross Section 2.2 The Born Approximation 2.2.1 Yukawa potential- Rutherford Scattering 2.3 Validity of the Born Approximation, Optical theorem 2.4 Method of Partial waves-Scattering by a perfectly rigid sphere 2.5 Scattering by a square well

potential - scattering length 2.6 Ramsauer-Townsend effect, Resonance scattering-Breit-Wigner formula.

### **Text Books**

1. A modern approach to Quantum Mechanics, Townsend.
2. Modern Quantum Mechanics, J.J. Sakurai, Revised Edition.

### **Unit III**

#### **Introduction to Relativistic Quantum Mechanics (18 hrs)**

3.1 Klein-Gordon equation-plane wave solutions 3.1.1 Interpretation -Probability conservation 3.1.2 Covariant notation 3.2 Derivation of Dirac equation 3.2.1 conserved current representation - large and small components 3.3 Approximate Hamiltonian for electrostatic problem 3.4 Free particle at rest -plane wave solutions - gamma matrices 3.5 Relativistic covariance of Dirac equation 3.6 Angular momentum as constant of motion.

### **Text Book**

1. Advanced Quantum Mechanics, J.J. Sakurai, Pearson Education (Chapter 3)

### **Unit IV**

#### **Classical Field Theory (8 hrs)**

4.1 Euler-Lagrange equation for fields 4.2 Hamiltonian formulation – functional derivatives 4.3 Conservation laws for classical field theory - Noether's theorem

#### **Non-Relativistic Quantum Field Theory(12 hrs)**

4.4 Quantization rules for Bose particles, Fermi particles - relativistic quantum field theory 4.5 Quantization of neutral Klein Gordon field 4.6 Canonical quantization of Dirac field 4.6.1 Plane wave expansion of field operator 4.6.2 Positive definite Hamiltonian

### **Text Book**

1. Field Quantization, W Greiner , J Reinhardt, Springer, (Chapter 2, 3,4 & 5)
2. Quantum mechanics - V.K. Thankappan, New Age Int. Publishers

### **Reference Books:**

1. Quantum Field Theory, Lewis H. Ryder, Academic Publishers, Calcutta, 1989
2. Quantum Field Theory, Claude Itzykson & Jean Bernard Zuber, MGH, 1986

3. Introduction to Quantum Field Theory, S.J. Chang, World Scientific, 1990
4. Quantum Field Theory, Franz Mandl & Graham. Shaw, Wiley 1990.

### **PH020304: COMPUTATIONAL AND ELECTRONICS**

#### **PRACTICALS**

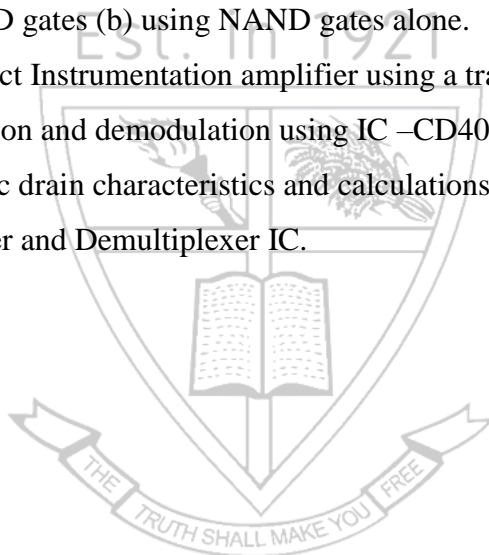

#### **Credit-5 (180 hours)**

*(Minimum of 12 Experiments should be done)*

(Experiments from 1 to 15 are C++ programs)

1. Motion of a spherical body in a viscous medium
2. Projectile motion and motion of a satellite
3. SHM – damped and forced oscillations
4. Formation of standing waves
5. Young's double slit – interference
6. Diffraction due to a grating
7. Polarisation and birefringence
8. Electric field due to a point charge and equi-potential surface
9. Motion in electric and magnetic fields – cyclotron
10. Solution of a differential equation – Runge kutta method
11. The variation of magnetic field with critical temperature in superconductivity
12. Finding the roots of a non-linear equation by bisection method
13. Solution of non linear differential equation - Bisection method
14. Numerical integration - rectangular method
15. Numerical integration - Simpson's rule
16. Microprocessor (use a PC or 8086- $\mu$ p kit) – Find the largest and smallest of numbers in array of memory.
17. Microprocessor (use a PC or 8086- $\mu$ p kit)– Sorting of data in ascending and descending order
18. Microprocessor (use a PC or 8086- $\mu$ p kit)– Measurement of Multi channel analog voltage using AC cards.
19. Microprocessor (use a PC or 8086- $\mu$ p kit) – Conversion of Hexadecimal number to ASCII and vice versa.
20. Design and construct a RF oscillator using transistor. Measure the frequency and compare it with the designed value. Repeat the same for at least two capacitors.

21. Design and construct a pulse width modulator using IC 741.
22. Design and construct a full wave controlled rectifier using IC 2P4M.
23. Generation of Frequency modulation using IC555 timer. Confirm the modulation index and repeat the experiment for minimum three input signal voltages.
24. Design and generation of Inverting and difference amplifiers using OP AMP
25. Generation of low distortion sine wave using OP AMP.
26. Design and construct a 4-bit binary synchronous counter using JK flipflops also construct the up counter/a down counter.
27. Design and construct a shift register using JK flipflops.
28. Design and construct a pulse amplitude modulator. Measure its output wave form.
29. To study Ripple Counter using Flip flops.
30. Design and setup half adder and full adder circuits and verify the truth tables (a) using X- OR and NAND gates (b) using NAND gates alone.
31. Design and construct Instrumentation amplifier using a transducer
32. Frequency modulation and demodulation using IC –CD4046.
33. FET: Study of static drain characteristics and calculations of various parameters
34. Study of Multiplexer and Demultiplexer IC.

## SEMESTER – IV

### PH020401: ATOMIC AND MOLECULAR SPECTROSCOPY

**Credit-4 (90 hours)**

**Objective of the course:** Objective of the course is to learn atomic, molecular and spin resonance spectroscopy. At the end of the course, the learner will be able to (i) describe the atomic spectra and change in behaviour of atom in external applied electric and magnetic field (ii) explain rotational, vibrational, electronic and Raman spectra of molecules (iii) describe electron spin and nuclear magnetic resonance spectroscopy and their applications.

#### Unit I

##### Atomic Spectra (18 hrs)

1.1 Vector atom model-electron spin- Stern-Gerlach experiment 1.2 LS and jj coupling schemes-spectroscopic terms-Pauli's exclusion principle 1.3 Spin-orbit interaction-interaction energy-interaction energy in LS and jj coupling schemes 1.4 Selection rule-Hund's rule-Lande interval rule 1.5 Normal and anomalous Zeeman effect -Paschen-Back effect 1.6 Stark effect in one electron systems-hyperfine structure-width of spectral lines.

##### Text Books

1. Atomic and Molecular Spectra: Laser – Raj Kumar
2. Spectroscopy (Vol. 2 & 3), B.P. Straughan & S. Walker, Science paperbacks 1976

#### Unit II

##### Resonance Spectroscopy (18 hrs)

2.1 ESR-Theory- Relaxation process- g factor- Experimental setup -Hyperfine structure applications 2.2 NMR- Theory -Relaxation process-Experimental technique- Chemical shift- Spin-spin coupling-applications. 2.3 Mössbauer effect- Theory- Experimental technique- Chemical isomer shift magnetic hyperfine interactions- Electric quadrupole interaction-applications

##### Text Book

1. Fundamentals of molecular spectroscopy – Colin N Banwell and Elaine M McCash

### Unit III

#### Microwave Spectroscopy (18 hrs)

3.1 Classification of molecules- Rotational spectra of rigid diatomic molecules  
Example of  $\text{CO}_2$   
3.2 Isotopic effect-intensity of rotational lines- Non rigid rotator- Example of HF  
3.3 Linear polyatomic molecules-symmetric top molecules  
3.4 Microwave spectrometer-information derived from rotational spectra.  
3.5 Infrared Spectroscopy -Vibrational energy of anharmonic oscillator -Diatomic vibrating rotator- Morse curve -IR spectra - Spectral transitions and selection rule  
3.6. Breakdown of Born - Openheimer approximation - vibrational spectra of polyatomic molecules  
3.7 Normal modes of vibration of  $\text{H}_2\text{O}$  and  $\text{CO}_2$  - overtones and combinations - Influence of rotation on the spectra of linear and symmetric top molecules  
3.8 IR spectroscopic analysis - FT-IR spectroscopy

#### Text Book

1. Fundamentals of molecular spectroscopy – Colin N Banwell and Elaine M .McCash

### Unit IV

#### Raman Spectroscopy (18hrs)

4.1 Raman effect- theory  
4.2 Rotational Raman spectra-linear molecules-symmetric top molecules  
4.3 Vibrational Raman spectra-rotational fine structure  
4.4 Raman activity-mutual exclusion principle  
4.5 Structure determination using Raman and IR spectroscopy  
4.5.1 Laser Raman spectrometer-Techniques and instrumentation  
Near Infra red FT Raman spectroscopy  
4.6 Hyper Raman Effect-classical treatment and experimental techniques  
4.7 Stimulated ,Inverse, coherent Antistokes and Photoacoustic Raman scattering.

### Unit V

#### Electronic Spectroscopy (18hrs)

5.1 Electronic spectra of diatomic molecules- progressions and sequences  
5.2 Frank Condon principle- rotational fine structure of electronic vibration spectra  
5.3 Fortrat parabola - dissociation- pre dissociation  
5.4 Fluorescence and phosphorescence - Photoelectron spectroscopy-principle instrumentation  
5.5 Informations from Photoelectron spectra- Auger electron spectroscopy-X Ray Fluorescence.

### **Text Book**

1. Molecular structure and spectroscopy, G. Aruldas, PHI.

### **Reference Books:**

1. Introduction of Atomic Spectra, H.E. White, Mc Graw Hill
2. Raman Spectroscopy, D.A. Long, Mc Graw Hill international, 1977
3. Introduction to Molecular Spectroscopy, G.M. Barrow, Mc Graw Hill
4. Molecular Spectra and Molecular Structure, Vol. 1, 2 & 3. G. Herzberg, Van Nostard, London.
5. Elements of Spectroscopy, Gupta, Kumar & Sharma, Pragathi Prakshan
6. The Infra Red Spectra of Complex Molecules, L.J. Bellamy, Chapman & Hall. Vol. 1 & 2.
7. Laser Spectroscopy techniques and applications, E.R. Menzel, CRC Press, India.

### **ELECTIVES**

## **BUNCH-A: MATERIAL SCIENCE-I SPECIALIZATION**

### **PH840301: THIN FILM SCIENCE AND CRYSTAL GROWTH TECHNIQUES**

**Credit-3 (54 hours)**

**Objective of the course:** At the end of this course student will be able to : i) Have the basic knowledge about the physics behind thin film and crystal growth mechanism ii) Have the understanding of vacuum techniques used for thin film growth iii) Have the knowledge about characterization methods and application of thin films iv) Have the basic theory of crystal growth v) Have the understanding of a variety of crystal growth mechanism vi) Have the understanding of thin film and crystal growth preparation techniques

### **UNIT I**

#### **Thin Film (18 hrs)**

- 1.1 Nucleation of thin films – Langmuir theory of condensation
- 1.2 Theories of nucleation – Liquid like coalescence and growth process – Epitaxial growth

1.2 Vacuum pumps and gauges– Exhaust pumps-rotary oil pump-molecular pump-diffusion pumps-Pirani gauge-penning gauge 1.4 Thickness measurement – optical methods-thickness monitor method 1.5 Properties of thin films- Morphological and structural properties-electrical and optical and properties 1.6 Applications of thin films- thin film as protective coating-thin film photovoltaic cells-thin film batteries-discrete resistive components

### **Text books**

1. Thin film phenomena, K.L Chopra, McGraw Hill, New York
2. Thin film fundamentals, A. Goswami, New Age International

## **UNIT II**

### **Crystal Growth from Melt and Solution Growth (20 hrs)**

2.1 Growth techniques- from the melt - the Bridgmann technique – crystal pulling  
2.2 Czocharalski method- experimental set up - controlling parameters advantages and disadvantages. 2.3 Convection in melts – liquid solid interface shape - crystal growth by zone melting 2.4 Verneuil's flame fusion technique. Low temperature solution growth 2.5 Methods of crystallization - slow cooling, solvent evaporation, temperature gradient methods

### **Text book**

1. P. SanthanaRagavan and P. Ramasamy, Crystal Growth Processes and Methods, KRU Publications, Kumbakonam (2001)

## **UNIT III**

### **Deposition Techniques (16 hrs)**

3.1 Physical vapour deposition – Resistive heating-flash evaporation-arc evaporation-exploding wire technique-electrode beam heating 3.2 Chemical vapour deposition (CVD)- pyrolysis, hydrogen reduction mechanism, polymerization 3.3 Cathodic sputtering-glow discharge sputtering, low pressure sputtering, AC and Dc Magnetron sputtering 3.4 Sol Gel method- Dip coating -Spin coating method 3.5 Pulse laser deposition technique- hydrothermal growth.

### **Text books**

1. Thin film phenomena, K.L Chopra, McGraw Hill, New York
2. Vacuum deposition of Thin films, L. Holland, Chapman Hall, London

**Reference Books:**

- 1.J.C. Brice, Crystal Growth Processes, John Wiley and Sons, New York (1986)
- 2.Handbook of thin film Technology, L.I Maissel and R Glang, McGraw Hill
3. Thinfilm deposition: Principles and practice-Donald.L. Smith
4. Materials science of thinfilms-Milton Ohring
5. Optical Properties of Thin Films, O. S. Heaven, Dover Publications
6. Crystallography for Solid State Physics: Verma & Shrivastava

**PH840402: NANOSCIENCE AND NANOTECHNOLOGY****Credit-3 (90 Hours)**

**Objective of the course:** On successful completion of the course the students will be able to understand the synthesis and properties of the nanoparticles, Distinguish the functionality of nanomaterial and their structural characteristics, Have an idea about nano electronics, Nanomagnetism and different carbon based nanostructures .

**Unit I****Introduction to Nanoscience& Synthesis of Nanomaterials (18 hrs)**

- 1.1 Definition of nanotechnology, Current technologies and problem, Nano the Beginning
- 1.2 Nano and energetics, Nano and implication
- 1.3 General issues of concern of Synthesis of Nanomaterial
- 1.4 Synthetic methods: the common issue of concern
- 1.5 Variety in nanomaterials, Microemulsion based methods for nanomaterial
- 1.6 Solvothermal synthesis
- 1.7 synthesis using support, using biology
- 1.8 Inert gas condensation.

**Text book**

- 1.A textbook of nanoscience and nanotechnology, T. Pradeep, Tata McGraw-Hill Education.

**Unit II****Theoretical understanding and Properties of Individual Nanoparticles (18 hrs)**

- 2.1 Quantum mechanics of low dimensional systems
- 2.2 Exciton confinement in quantum dots
- 2.3 Quantum mechanics of confined nanoclusters
- 2.4 Band Gap engineering and optical response
- 2.5 Metal Nanoclusters : Magic numbers , Geometric Structure, Electronic Structure, Reactivity, Fluctuations, Magnetic Clusters Bulk to

Nanotransition 2.6 Semiconducting Nanoparticles: Optical Properties, Photofragmentation, Coulombic Explosion 2.7 Rare Gas and Molecular Clusters: Inert-Gas Clusters, Superfluid Clusters

### **Text books**

1. Introduction to Nanotechnology - Charles P. Poole Jr. and Franks. J. Qwens
2. A textbook of nanoscience and nanotechnology, T. Pradeep, Tata McGraw-Hill Education.

### **Unit III**

#### **Structural Characterization of Nanomaterials(18 hrs)**

3.1 Scanning Electron Microscopy (SEM) 3.2 Transmission Electron Microscopy (TEM), Environmental TEM, Scanning Transmission electron Microscopy (STEM), 3.3 In situ nano measurements, EELS 3.4 Electron Diffraction as Tool 3.5 Scanning Tunnelling Microscopy (STM) 3.6 Atomic Force Microscopy 3.7 Confocal Microscopy, Scanning near field optical microscopy (SNOM). 3.8 X-ray diffraction (XRD), Small angle X-ray scattering (SAXS)

### **Text book**

1. A textbook of nanoscience and nanotechnology, T. Pradeep, Tata McGraw-Hill Education.

### **Unit-IV**

#### **Carbon Nano structures& Special Nanomaterials(18 hrs)**

4.1. Carbon fullerenes, Fullerene-derived crystals, Carbon nanotubes 4.2. Micro and Mesoporous Materials: Ordered mesoporous structures, Random mesoporous structures, Crystalline microporous materials: zeolites 4.3 Core-Shell Structures: Metal-oxide structures, Metal-polymer structures, Oxide-polymer structures 4.4 Organic-Inorganic Hybrids: Class I hybrids, Class II hybrids 4.5. Intercalation Compounds 4.6 Nanocomposites and Nanograined Materials.

### **Text book**

1. Nanostructures and Nanomaterials - Synthesis, Properties and Applications – Guozhong Cao, Imperial college press

### **Unit V**

#### **Molecular electronics, Nanolithography, Nanomagnetism (18 hrs)**

5.1 Molecules and experimental advance 5.2 Mechanism of molecular transport and advanced application 5.3 Lithography Concepts and definition 5.4 Photolithography,

scanning probe lithography, soft lithography 5.5 Nano manipulation 5.6 Basics of magnetism, magnetic nanostructures 5.7 Magnetism of nanosized materials 5.8 Application of nanomagnetic materials

### **Text book**

1. A textbook of nanoscience and nanotechnology, T. Pradeep, Tata McGraw-Hill Education.

### **Reference Books: .**

1. Introduction to nanoscience and nanotechnology. Chris Binns, John Wiley & Sons
2. Basic Principles of Nanotechnology, By Wesley C. Sanders, CRC Press
3. Textbook of nanoscience and nanotechnology. B. S. Murty, Springer
4. Handbook of microscopy for nanotechnology. Nan Yao, Lin Wang Zhong, Kluwer academic publishers.
5. Nano: the essentials. T. Pradeep, Tata McGraw-Hill Education.
6. Fundamentals of nanotechnology, G. L Hornyak, H. F. Tibbals, J. Dutta, & J. J Moore. CRC press.
7. Introduction to Nanoscience, Gabor L. Hornyak, Joydeep Dutta, H.F. Tibbals, Anil Rao, CRC Press
8. Handbook of Nano Physics Nanoparticles and Quantum Dots Klaus D Sattler CRC Press Taylor and Francis Group

## **PH840403: MATERIALS SCIENCE AND ENGINEERING**

**Credit - 3(90 Hours)**

**Objective of the course:** The course is primarily designed for Material science students. Therefore, focus of the course is on structural materials. The course is hoping to address both theoretical and practical aspects of materials science and engineering. To serve this purpose, the course is divided into five different units. a) Bonding in materials, b) imperfections and diffusion mechanism c) Polymer structure, d) Mechanical properties and e) different Types and Applications of Materials.

## **Unit I**

### **Atomic Structure and Interatomic Bonding in materials (18 hrs)**

1.1 Historical Perspective of Materials Science 1.2 Classification of Materials - Fundamental Concepts of Electrons in Atoms -The Periodic Table 1.3 Atomic Bonding In Solids : Bonding Forces and Energies 1.4 Primary Interatomic Bonds: Ionic Bonding, Covalent Bonding, Metallic Bonding 1.5 Secondary Bonding or Van der Waals Bonding 1.6 Molecules- Crystal Structures: Fundamental Concepts, Unit Cells 1.7 Metallic Crystal Structures.

#### **Text book**

1. Fundamentals of Materials Science and Engineering: An Interactive e.Text, 5th Edition by William D. Callister and William D. Callister Jr. Wiley

## **Unit II**

### **Imperfections and Diffusion in solids(18 hrs)**

2.1 Point Defects in Metals - Point Defects in Ceramics 2.2 Impurities in Solids 2.3 Specification of Composition 2.4 Dislocations—Linear Defects -Interfacial Defects 2.5 Grain size Determination 2.6 Diffusion Mechanisms- Steady-State Diffusion , Nonsteady-State Diffusion 2.7 Factors That Influence Diffusion

#### **Text book**

1. Fundamentals of Materials Science and Engineering: An Interactive e.Text, 5th Edition by William D. Callister and William D. Callister Jr. Wiley

## **Unit III**

### **Polymer Structures (18 hrs)**

3.1 Hydrocarbon Molecules -Polymer Molecules -The Chemistry of Polymer Molecules 3.2 Molecular Weight, Shape and Structure 3.3 Molecular Configurations 3.4 Thermoplastic and Thermosetting Polymers- Copolymers 3.5 Polymer Crystallinity -Polymer Crystals

#### **Text book**

1. Fundamentals of Materials Science and Engineering: An Interactive e.Text, 5th Edition by William D. Callister and William D. Callister Jr. Wiley

## Unit IV

### Mechanical Properties (18 hrs)

4.1 Concepts of Stress and Strain 4.2 Elastic Deformation: Stress–Strain Behavior, Anelasticity 4.3 Elastic Properties of Materials 4.4 Mechanical behavior of metals: Tensile Properties, True Stress and Strain –Compressive, Shear and Torsional deformation 4.5 Mechanical behavior of ceramics: Flexural Strength, Elastic Behavior 4.6 Mechanical behavior of Polymers: Stress–Strain Behavior, Macroscopic Deformation – Hardness and other mechanical property considerations - Tear strength and hardness of polymers 4.7 Property variability and design/safety factors

### Text book

1. Fundamentals of Materials Science and Engineering: An Interactive e.Text, 5th Edition by William D. Callister and William D. Callister Jr. Wiley

## Unit V

### Types and Applications of Materials (18 hrs)

5.1 Ferrous Alloys 5.2 Nonferrous Alloys 5.3 Types of ceramics: Glasses, Glass–Ceramics, Clay Products 5.4 Refractories, Abrasives, Cements 5.5 Advanced Ceramics, Diamond and Graphite 5.6 Types of polymers: Plastics, Elastomers, Fibers, Miscellaneous Applications 5.7 Recycling issues in materials science and engineering

### Text book

1. Fundamentals of Materials Science and Engineering: An Interactive e.Text, 5th Edition by William D. Callister and William D. Callister Jr. Wiley

### References Books:

1. An Introduction to Materials Engineering and Science for Chemical and Materials Engineers: Brian S. Mitchell, Wiley
2. Materials Science and Engineering an Introduction, W. D. Callister, Jr., John, Wiley
3. Materials Science and Engineering A First Course 5 ed., V. Raghavan, Prentice Hall of India Pvt. Ltd.
4. Materials: Introduction and Applications, Witold Brostow and Haley E. Hagg Lobland, Wiley
5. Material science and Processes, A.K Hajara Choudhury, Indian Book Distributing Co

## **PH840404: MATERIAL SCIENCE PRACTICALS**

**Credit-5 (180 hours)**

*(Minimum of 12 Experiments should be done)*

### **Section A**

#### **GENERAL MATERIAL SCIENCE EXPERIMENTS**

1. Study the resistivity of a single crystal by four probe method at constant deviation of temperature and find the energy gap of the material.
2. Compare the capacitance of a ceramic and a polymer capacitance with temperature. Show that the dielectric constant of the ferroelectric material used in the ceramic capacitor follows Curie-Weiss law.
3. Study the variation of voltage with respect to temperature for a semiconducting material and determine the bandgap energy
4. Using hall effect set up, determine (a) Hall coefficient (b) Mobility of charge carriers (c) Carrier concentration.
5. Observe Zeeman effect and measure the shift of atomic energy levels in an external magnetic field.
6. Determine the absolute Seebeck co-efficient of copper and constantan as a function of temperature.
7. Study the para to ferroelectric transition in barium titanate and determine the Curie temperature.
8. Determine the young's modulus of a metal using strain gauge apparatus.
9. Study the variation in electrical conductivity with temperature of NaCl / KCl and determine the vacancy migration energy and formation energy of vacancy pairs.
10. Measure the absolute Seebeck coefficient of n-type and p-type Bismuth telluride.
11. Determine the Fermi energy and Fermi temperature of copper using CF bridge by measuring its temperature coefficient of resistance.
12. Ultrasonic Interferometer – ultrasonic velocity in liquids
13. Ultrasonic Interferometer – Young's modulus and elastic constant of solids

## **Section B**

### **ADVANCED MATERIALS EXPERIMENTS**

1. Study the dependence of Hall coefficient on temperature and nature of majority charge carriers using Hall effect set-up.
2. Determine the Lande g-factor of electron using an ESR spectrometer
3. Determination of lattice constant of a cubic crystal with accuracy and indexing the Bragg reflections in a powder X-ray photograph of a crystal.
4. Determine the dipole moment of an organic molecule using a cylindrical capacitor.
5. Crystal growth-Slow evaporation technique- Determination of saturation coefficient and linear density
6. Synthesis of nano particle by Sol-gel method
7. Preparation of glassy materials using Solgel technique
8. Thin film fabrication using dip coating technique and its thickness measurements
9. Preparation of nano colloids by varying PH scale using chemical synthesis
10. Morphological analysis of nano particles using simulation technique and Sherrer equation
11. Electrical conductivity of electrolytes using conductivity meter and its PH measurements
12. Study the dielectric measurements of a material as a function of frequency using LCR Q-Meter.
13. Compare the optical absorption spectrum of a direct and an indirect bandgap semiconductor specimen using simulation technique and estimate the bandgap in each case.

## **Section C**

### **OPTICS AND LASER PHYSICS EXPERIMENTS**

1. Study the photo conductivity characteristics of a semiconducting material with the variation in light intensity.
2. Study the beam profile and determine the spot size of diode laser.
3. Verify Malu's law of polarization using laser.
4. Measure the coefficient of linear expansion of a solid by Fizeau's interferometer configuration.
5. Determination of the distance between the grooves of a Compact and Digital

versatile Disk using laser beam.

6. Compare the optical absorption spectrum of a direct and an indirect bandgap semiconductor specimen and estimate the bandgap in each case.
7. Determination of wavelength of an unknown light source using a compact disk.
8. Measurement of absorption coefficient of a given material using laser light.
9. Determination of Numerical aperture of an optical fibre
10. Determination of least count of the given meter scale using laser.
11. Determination particle size of given sample using a laser beam.
12. Determination of characteristics of a solar cell.
13. To study the photoelectric effect and determination of Plank's constant using LED.

## **BUNCH-B: MATERIAL SCIENCE-II SPECIALIZATION**

### **PH850301: OPTOELECTRONICS**

**Credit -3 (54 Hours)**

**Objective of the course:** The course is an introduction to the fundamentals of optoelectronics and principals of the optoelectronics devices. This course gives the students to acquire knowledge in the field of fibre optics technology. This course also provides the background in optoelectronics helps students to meet the demand of growing semiconductor optoelectronic industry and prepares them to advance study and research in the semiconductor optics and optoelectronic devices.

#### **Unit I**

##### **Light emitting diode and Fibre Optics (18 hrs)**

1.1 Direct and indirect bandgap semiconductors, pn junction under forward and reverse bias 1.2 light emitting diodes, principle, device structures 1.3 LED materials, heterojunction high intensity LEDs 1.4 double heterostructure, LED characteristics and LEDs for optical fiber communications, surface and edge emitting LEDs. 1.5 Symmetric planar dielectric slab waveguide, waveguide condition, single and multimode waveguides 1.6 TE and TM modes, modal and waveguide dispersion in the planar waveguide, dispersion diagram, intermodal dispersion, intramodal dispersion, dispersion in single mode fibers, material dispersion, waveguide dispersion 1.7 chromatic dispersion, profile and polarization dispersion, dispersion

flattened fibers, bit rate and dispersion 1.8 optical and electrical bandwidth, graded index optical fiber 1.9 light absorption and scattering 1.10 attenuation in optical fibers.

### **Text books**

1. Optoelectronics and Photonics: Principles and Practices, S.O. Kasap, Pearson, (2009)
2. Fiber optics and Optoelectronics, R.P. Khare, Oxford University Press, (2004),

## **Unit II**

### **Laser principles, Photodetectors and photovoltaics (20 hrs)**

2.1 Laser oscillation conditions, diode laser principles, heterostructure laser diode 2.2 Double heterostructure, stripe geometry, buried heterostructure, gain and index guiding, laser diode characteristics, laser diode equation 2.3 Single frequency solid state lasers, distributed feedback, quantum well lasers, vertical cavity surface emitting laser, optical laser amplifiers. 2.4 Principle of p-n junction photodiode 2.5 Ramo's theorem and external photocurrent 2.6 Absorption coefficient and photodiode materials, quantum efficiency and responsivity 2.7 PIN-photodiode, avalanche photodiode, phototransistor, photoconductive detectors and photoconductive gain 2.8 Noise in photo-detectors, noise in avalanche photodiode, solar energy spectrum 2.9 Photovoltaic device principles I-V characteristics, series resistance and equivalent circuit, temperature effects 2.10 Solar cell materials, device and efficiencies

### **Text books**

1. Optoelectronics and Photonics: Principles and Practices, S.O. Kasap, Pearson, (2009)
2. Laser fundamentals, William T. Silfvast, CUP 2nd Edn. (2009)

## **Unit III**

### **Optoelectronic modulators and Non-linear optics (16 hrs)**

3.1 Optical polarization, birefringence 3.2 retardation plates, electro-optic modulators 3.3 Pockels effect, longitudinal and transverse electro-optic modulators 3.4 Kerr effect, Magneto-optic effect 3.5 Acousto-optic effect, Raman Nath and Bragg-types. 3.6 Polarization response of materials to light 3.7 Harmonic generation, second harmonic generation 3.8 phase matching, third harmonic generation 3.9 Optical mixing, sum and difference frequencies 3.10 Parametric generation of light, self focusing of intense light beams.

### **Text books**

1. Optoelectronics and Photonics: Principles and Practices, S.O. Kasap, Pearson, (2009)
2. Optoelectronics: an Introduction, J. Wilson and J.F.B. Hawkes, PHI, (2000)
3. Lasers and non-linear optics, B. B. Laud, New Age Pub (2011).

### **Reference Books:**

1. Semiconductor optoelectronic devices: Pallab Bhattacharya, Pearson(2008)
2. Optoelectronics: An introduction to materials and devices, Jasprit Singh, McGraw Hill International Edn., (1996).
3. Optical waves in crystals: Propagation and Control of Laser Radiation, A. Yariv and P. Yeh, John Wiley and Sons Pub. (2003)

## **PH850402: SEMICONDUCTOR DEVICES**

**Credit-3 (90 Hours)**

**Objective of the course:** Objectives of this subject ensures the students to expand their knowledge in semiconductor physics and provide a foundation for further advanced studies. After completing the course the student will (1) understand the fundamental concepts of charge carriers transport phenomenon in semiconductors (2) Understand the concepts of p-n junction (3) Understand the mode of operations of bipolar transistors (4) Understand the features of Metal-semiconductor and semiconductor hetero-junctions (5) This course also provides the perceptsives of Integrated Circuit Fabrication and Characteristics

### **Unit I**

#### **Carrier transport phenomena (18 hrs)**

1.1 Carrier transport phenomena - carrier drift 1.2 Drift current density - mobility effects- conductivity 1.3 Velocity saturation - carrier diffusion- diffusion current density- total current density 1.4 Nonequilibrium excess carriers in semiconductors 1.5 Semiconductor in equilibrium 1.6 Excess carrier generation and recombination- characteristics of excess carriers 1.6 Continuity equation 1.7 Ambipolar transport 1.8 Dielectric relaxation time constant- quasi Fermi energy levels 1.9 Excess carrier life time-surface effects.

### **Text book**

1. Semiconductor Physics and Devices, Donald A. Neamen, McGraw Hill

## **Unit II**

### **PN junction(18 hrs)**

2.1 Basic structure of a p-n junction 2.2 Built-in potential- electric field 2.3 Space charge widths 2.4 Forward and reverse biasing 2.5 Junction capacitance- one sided junctions 2.6 p-n junction current- ideal current voltage relationship 2.7 Boundary conditions, minority carrier distribution 2.8 Ideal p-n junction current, temperature effects, short diode 2.9 Generation-recombination currents-reverse bias generation current 2.10 forward bias recombination current- total forward bias current-junction breakdown.

#### **Text book**

1. Semiconductor Physics and Devices, Donald A. Neamen, McGraw Hill

## **Unit III**

### **Metal-semiconductor and semiconductor hetero-junctions(18 hrs)**

3.1 Metal-semiconductor - Schottky barrier diode - qualitative characteristics – ideal junction properties 3.2 Current voltage relationship, Comparison with junction diode 3.3 Metal semiconductor ohmic contact 3.4 Ideal non rectifying barriers – tunneling barrier – specific contact resistances 3.5 Semiconductor hetero-junctions – hetero-junction materials – energy band diagram – Two dimensional electron gas 3.6 Equilibrium electrostatics

#### **Text book**

1. Semiconductor Physics and Devices, Donald A. Neamen, McGraw Hill

## **Unit IV**

### **Bipolar transistor(18 hrs)**

4.1 Bipolar transistor action-basic principle of operation 4.2 Simplified transistor current relations 4.3 Modes of operation- amplification with bipolar transistors 4.4 Minority carrier distribution 4.5 Forward active mode- low frequency common-base current gain 4.6 Contributing factors, non-ideal effects-high injection 4.7 current crowding- breakdown voltage 4.8 Transistor equivalent circuit models- Elbers-Moll

model-frequency limitations- time delay factors 4.9 Transistor cutoff frequency-large signal switching-switching characteristics.

### **Text books**

1. Solid state electronic devices, Streetman and Banerjee, PHI (2010).
2. Physics of Semiconductor Devices, Michael Shur, PHI (2002).
3. Introduction to Semiconductor materials and Devices, M.S. Tyagi, John Wiley and Sons (2000)

### **Unit V**

#### **Integrated Circuit Fabrication and Characteristics (18 hrs)**

5.1 Integrated circuit technology – basic monolithic IC – epitaxial growth –marking and etching 5.2 Diffusion of impurities – transistor for monolithic circuit 5.3.Monolithic diodes – integrated resistors, capacitors and inductors5.4 monolithic circuit layout - additional isolation methods -MSI, LSI, VLSI– the metal semiconductor contact.

### **Text book**

1. Integrated Electronics-Analogue and Digital Circuits and Systems, J Millmann and C Chalkias, TMGH

### **Reference Books:**

1. 8085 to 8088 Introduction to Microprocessors for Engineers and Scientists.- P.K. Gosh & P.R. Sridhar, PHI
2. Advanced microprocessors and peripherals, A.K. Ray & K.M. Burchandi –TMH.
3. Microprocessor and microcontroller, R. Theagarajan- SCITECH Publications India Pvt. Ltd.
4. Microprocessor and Peripherals, S.P. Chowdhury & S. Chowdhury- SCITECH Publications
5. Operating system Principles, Abraham Silberschatz & Peter Baer Galvin & Greg Gagne, John Wiley
6. Solid state electronic devices, Streetman and Banerjee, PHI (2010).
7. Physics of Semiconductor Devices, Michael Shur, PHI (2002).
8. Introduction to Semiconductor materials and Devices, M.S. Tyagi, John Wiley and Sons (2000)

## **PH850403: CERAMICS AND BIOMATERIALS**

**Credit - 3 (90 Hours)**

### **UNIT I**

#### **Ceramics (18 hrs)**

1.1 Introduction to ceramic materials, 1.2 Structure of oxide and nonoxide ceramics, 1.3 Review of defects and diffusion in ionic solids, 1.4 Ionic conductivity. 1.5 Linear dielectrics, 1.6 Frequency dependence of polarization and associated mechanisms, Impedance spectroscopy, 1.7 Breakdown mechanisms, 1.8 Material design for dielectric constants, 1.9 Dielectric materials for microwave, 1.10 thin film capacitor

#### **Text Books**

1. Ceramic Materials - Science and Engineering , C. Barry Carter, M. Grant Norton, Springer Science & Business Media
2. Principles of Electronic Ceramics, L.L. Hench and J. K. West, Wiley

### **Unit II**

#### **Ferroelectric Ceramics (18 hrs)**

2.1 Non-linear dielectrics, 2.2 Structural origin of non-linear behaviour, 2.3 Ferroelectrics and Piezoelectrics, 2.4 Thermodynamic formulation of ferroelectrics, 2.5 Domains, Applications of ferroelectric bulk and thin films, 2.6 Microstructure - property relationships, Applications of piezoelectric materials in transducers, 2.7 electrochemical filters and positioning devices. 2.8 Electro-optic ceramics: Optical phenomena - birefringence, 2.9 linear and quadratic electro-optic effects (Pockels and Kerr)

#### **Text Book**

1. Ceramic Materials - Science and Engineering , C. Barry Carter, M. Grant Norton, Springer Science & Business Media

### **Unit III**

#### **Magnetic ceramics (18 hrs)**

3.1 Magnetic ceramics and their applications in power transformers, filters, microwave ferrites, recording media, etc. 3.2 New high permeability materials, 3.3 Novel recording media, 3.4 Giant and colossal magneto-resistance, 3.5 Magneto-electronics. 3.6 High temperature super- conductors: Review of superconductivity and

their applications to high field magnets, 3.7 Josephson junction.

### **Text Book**

1. Magnetic Ceramics, Raul Valenzuela, Cambridge University Press

### **Unit IV**

#### **Biomaterial (18 hrs)**

4.1 Atomic description of biomolecules: DNA, RNA, and proteins; 4.2 forces and energetic in living systems: cells; 4.3 Statistical physics in biology: energy and entropy in complex biomolecules, 4.4 molecular machines; Molecular modeling of biological problems: Brownian motion and diffusion, 4.5 protein folding, enzyme reaction; 4.6 Biomechanics: statics and human anatomy, 4.7 mechanics of motion.

### **Text Books**

1. Nelson P., Biological Physics: Energy, Information, Life, Freeman.
2. Dill Ken and Bromberg Sarina, Molecular Driving Forces: Statistical thermodynamics in Biology, Chemistry, Physics and Nanoscience, Garland Science.

### **Unit V**

#### **Analysis Techniques (18 hrs)**

5.1 Quantitative measurement techniques to investigate biological problems: 5.2. Nuclear magnetic resonance spectroscopy: working, application 5.3 Raman spectroscopy, 5.4 ultrafast spectroscopy, 5.5 magnetic resonance imaging, 5.6 optical microscopy, 5.7 Transmission electron microscopy

### **Text Books**

1. Lodish H. et al., Molecular Cell Biology, Freeman.
2. Alberts B. et. al., Molecular Biology of the Cell, Garland Science.

### **References Books:**

1. Nonstoichiometry, diffusion and electrical conductivity in binary metal oxides, Per Kofstad, Wiley
2. Nonstoichiometric Oxides, O. Toft Sorensen, Academic Press
3. Electroceramics: Materials, Properties, Applications, A. J. Moulson, J. M. Herbert, Wiley
4. Transition Metal Oxides, C.N.R. Rao and B. Raveau, Wiley-VCH
5. Basic Solid State Chemistry, A.R. West, Wiley
6. Structure and Properties of Inorganic Solids, F.S. Galasso, Pergamon Press

7. A textbook of nanoscience and nanotechnology, T. Pradeep, Tata McGraw-Hill Education
8. Fundamentals of Materials Science and Engineering: An Interactive e.Text, 5th Edition by William D. Callister and William D. Callister Jr. Wiley

### **PH850404: ADVANCED MATERIAL SCIENCE PRACTICALS**

**Credit-5 (180 hours)**

*(Minimum of 12 Experiments should be done)*

1. Determine the dielectric constant of a non-polar liquid using a cylindrical capacitor.
2. Measure the electrical and thermal conductivity of copper and determine the Lorentz number.
3. Crystal growth – Slow evaporation technique – determination of saturation coefficient and linear density.
4. Synthesis of nano particle by Sol-gel method
5. Preparation of glassy materials using Solgel technique
6. Thin film fabrication using dip coating technique and its thickness measurements
7. Morphological analysis of nano particles using simulation technique and Sherrer equation
8. XRD – Crystal structure determination Cubic/ Hexagonal
9. XRD – Determination of Crystal size and lattice strain
10. Electrical conductivity of electrolytes using conductivity meter and its PH measurements
11. Study the photo conductivity characteristics of a semiconducting material with the variation in light intensity.
12. Determine the dipole moment of an organic molecule using a cylindrical capacitor.
13. Using hall effect set up, determine (a) Hall coefficient (b) Mobility of charge carriers (c) Carrier concentration.
14. Calibrate a thermocouple as a temperature sensor.
15. Study the beam profile and determine the spot size of diode laser.
16. Determine the absolute Seebeck co-efficient of copper and constantan as a function of temperature.
17. Determine the Lande g-factor of electron using an ESR spectrometer.

18. Determine the magnetic susceptibility of a paramagnetic solution by Quincke's method and hence prove that water is diamagnetic.
19. Verify Malu's law of polarization using a He-Ne laser.
20. Measure the coefficient of linear expansion of a solid by Fizeau's interferometer configuration.
21. Determination of track width and pit width for a CD/DVD using laser beam.
22. Measure the absolute Seebeck coefficient of n-type and p-type Bismuth telluride.
23. Study the photo conductivity characteristics of a semiconducting material with the variation in light intensity.
24. Study the dependence of Hall coefficient on temperature and nature of majority charge carriers using Hall effect set-up.
25. Determine the average wavelength of sodium D lines and the thickness of a glass slide using a Michelson Interferometer.
26. Determine the band gap energy of germanium using a reverse biased p-n junction diode.
27. Determine the drift mobility of carriers in a semiconductor specimen using Haynes-Shockley experiment.
28. Determine the minority carrier life time of a semiconductor specimen using photoconductive decay method.
29. Determine the dielectric constant of a sheet by using it as a parallel plate capacitor in an oscillator.
30. Determine the dielectric constant of ADP/ KDP crystal using electro-optic effect.
31. Study the resistivity of a single crystal by four probe method at constant deviation of temperature and find the energy gap of the material.
32. Compare the optical absorption spectrum of a direct and an indirect bandgap semiconductor specimen and estimate the bandgap in each case.
33. Determination of lattice constant of a cubic crystal with accuracy and indexing the Bragg reflections in a powder X-ray photograph of a crystal.
34. Study the I-V characteristics, I-P characteristics, modulation bandwidth and output spectrum of an LED.
35. Determination of characteristics of a solar cell.
36. To study the photoelectric effect and determination of Plank's constant using LED.
37. Ultrasonic Interferometer – ultrasonic velocity in liquids

38. Study the dielectric property of a thin film using LCR Q-Meter.
39. Study the structural and melting transition in  $\text{KNO}_3$  using a differential thermal analyzer

## **4.3 M.Sc. PHYSICS - MATERIAL SCIENCE**

### **MODEL QUESTION PAPERS**

**MAHATMA GANDHI UNIVERSITY**

**PG-CSS PHYSICS MODEL QUESTION PAPER**

**First Semester**

**Faculty of Science**

**Physics- Material Science**

**PH020101: APPLIED MATHEMATICS FOR PHYSICS- I**

**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

#### **Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Define metric tensor.
2. Distinguish between contravariant and covariant tensor.
3. State Stokes theorem.
4. Show that for Hermitian matrices A & B, which obeys  $AB - BA = iC$ , C is also hermitian.
5. Show that  $\nabla \times (\nabla \times \vec{A}) = \nabla (\nabla \cdot \vec{A}) - \nabla^2 \vec{A}$
6. Calculate the work done when a force  $F = 3xy \mathbf{i} - y^2 \mathbf{j}$  moves a particle in the xy – plane from (0, 0) to (1, 2) along the parabola  $y = 2x^2$ .
7. Express  $\nabla \phi$  in orthogonal curvilinear coordinates.
8. Write a note on inner product space.
9. Prove that Christoffel symbol of first kind is not a tensor.
10. Show that in Euclidian space the Geodesics create straight line.

**(8 x 1 = 8)**

#### **Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Obtain the Recurrence relation for Laguerre polynomials:

$$(n+1) L_{n+1}(x) = (2n+1-x) L_n(x) - n L_{n-1}(x)$$

12. Show that rotation of co-ordinate is orthogonal transformation.

13. Diagonalize matrix

$$A = \begin{pmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 1 \end{pmatrix}$$

14. Show that any inner product of the tensors  $A^p$  and  $B_{qs}$  is a tensor of rank 3.

15. Show that eigen values of hermitian matrix are real and its eigen vectors corresponding to two distinct eigen values are orthogonal.

16. Explain Poisson distribution with one example.

17. Prove the orthogonality relation for Bessel function

$$\int_0^1 x J_n(\alpha x) J_n(\beta x) dx = 0$$

18. Prove the relations (a)  $H_n(-x) = (-1)^n H_n(x)$  (b)  $H'_n(x) = 2nH_{n-1}(x)$

(6 x 2 = 12)

### Part C

Answer any **two** questions.

Each question carries 5 weights.

19. Find  $\nabla \cdot A$  and  $\nabla \times A$  in orthogonal curvilinear coordinates.

20. Obtain generating function for Laguerre function and find the value of:  $mJ_{1/2}(x)$  and  $J_{+3/2}(x)$

21. Find the inverse of

$$A = \begin{pmatrix} 2 & 2 & 1 \\ 1 & 3 & 2 \\ 1 & 1 & 3 \end{pmatrix}$$

22. Write the mathematical form of generalized covariant derivative of a tensor of arbitrary rank? Derive the expression for  $j^{\text{th}}$  covariant derivative of a tensor?

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**

**First Semester**

**Faculty of Science**

**Physics- Material Science**

**PH020102: BASIC QUANTUM MECHANICS**

Time : 3 Hours.

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Write a note on Dirac's bra and ket notation.
2. Mention any two properties of inner product.
3. What is zero point energy of harmonic oscillator? Explain it with the help of uncertainty principle.
4. What are the basic quantum numbers that designate the states of hydrogen atom? Give the allowed values of these quantum numbers.
5. What is time evolution operator? Give its properties.
6. Observables are Hermitian operators. Why?
7. Why  $J_+$  and  $J_-$  are called raising and lowering operator?
8. What are Pauli spin matrices? Explain their properties.
9. Explain the condition for validity of WKB approximation.
10. Distinguish between Schrodinger picture and Heisenberg picture.

(8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Discuss the Zeeman effect.
12. Derive the general uncertainty relationship.
13. Explain the variation principle for determining the ground state energy of a system.

14. State and explain Ehrenfest's theorem.
15. If  $L = r \times p$ , prove that  $[L_x, L_y] = i\hbar L_z$ .
16. Derive matrices for the operators  $J^2$ ,  $J_z$ ,  $J_x$  and  $J_y$  for  $j = 3/2$ .
17. Explain Schrodinger and Heisenburg pictures in quantum mechanics
18. Explain Stern-Gerlach experiment.

(6 x 2 = 12)

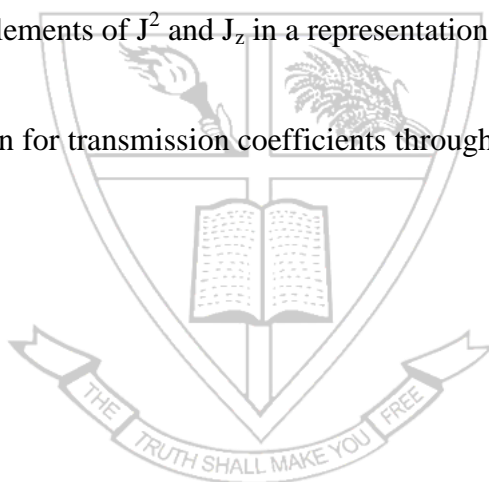

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. Comment on position and momentum space wave functions. Also prove that Gaussian wave packet is a minimum uncertainty wave packet.
20. Solve the problem of linear harmonic oscillator using creation and annihilation operators.
21. Obtain the matrix elements of  $J^2$  and  $J_z$  in a representation in which  $J^2$  and  $J_z$  are diagonal.
22. Derive an expression for transmission coefficients through a potential barrier.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**First Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH020103: CONDENSED MATTER PHYSICS**  
**(2025 admission onwards)**

Time: 3 Hours.

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. What are ferroelectric crystals? Name any two components that exhibit ferroelectricity.
2. What are ferroelectric domains?
3. Differentiate Type1 and Type2 superconductors.
4. Differentiate diamagnetic and paramagnetic materials.
5. What is Hall Effect?
6. Explain the isotope effect in Super Conductivity.
7. Distinguish between acoustic and optical phonons.
8. Explain the effective mass of electron.
9. Explain Bloch theorem.
10. Explain harmonic approximation in lattice vibrations.

**(8 x 1 = 8)**

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights*

11. (a) For argon gas,  $N = 10^{19} \text{cm}^{-3}$ ,  $Z = 18$  and  $r = 10^{-8} \text{cm}$ . Calculate the electronic polarization for an applied field of 10 KV/cm. (b) Silicon has the dielectric constant 12, and edge length of the conventional cubic cell of Silicon lattice is  $5.43 \text{\AA}$ . Calculate the electronic polarisability of Silicon atoms.

12. Show that the intermediate state consists of regions of normal and superconducting metal.
13. Show that how the London equations lead to the Meissner effect and the flux penetration through thin films of superconductors.
14. Discuss the normal and umklap process.
15. Explain the inelastic scattering of neutrons by phonons.
16. A two –dimensional hexagonal lattice spacing  $a = 3 \text{ \AA}$ , and one electron per unit cell. If the electrons are considered free within the two – dimensional plane, what is the Fermi energy  $E_F$  (Provide a numerical value in eV).
17. Derive an expression for the density of available electron states
18. Explain Wiedemann Franz law.

(6 x 2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. What is single particle tunneling. Derive an expression for AC and DC Josephson effects.
20. Distinguish between diamagnetism and paramagnetism. Derive Langevin's diamagnetic equation.
21. Discuss Debye model of lattice heat capacity. Derive an expression for it.
22. What is Fermi surface? Discuss the construction of Fermi surfaces.

(2 x 5 =10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**

**First Semester**

**Faculty of Science**

**Physics- Material Science**

**PH020104: CLASSICAL MECHANICS AND RELATIVITY**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. State the Hamiltonian conservation theorem.
2. State and explain the least action principle.
3. Derive the relationship between Poisson bracket and Lagrange bracket.
4. How does the short wavelength limit of Schroedinger equation leads to Hamilton-Jacobi equation?
5. Discuss the nature of Coriolis' force.
6. What are the advantages of Hamiltonian formalism over Lagrangian formalism?
7. State the Kepler's laws of planetary motion.
8. Outline the principle of equivalence.
9. What is meant by a linear system and a non linear system?
10. What is Lyapunov exponent? What is its significance?

(8×1=8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Using Hamilton's equations, show that the angular momentum is conserved in a central force problem.
12. Using Poisson brackets, check whether the transformation defined by

$$q = \sqrt{2P} \sin Q$$

$$p = \sqrt{2P} \cos Q \text{ is canonical.}$$

13. Prove that the rotational kinetic energy is conserved in the torque free motion of a

rigid body.

14. For a diatomic molecule consisting of masses  $m_1$  and  $m_2$  connected by a spring of force constant  $k$  vibrating along the line joining the masses, determine the normal frequencies and normal co-ordinates.

15. Solve the differential equation of a linear harmonic oscillator  $\frac{d^2x}{dt^2} + \omega^2 x = 0$  by quadrature method.

16. Solve the problem of Harmonic oscillator by Hamilton-Jacobi method.

17. Obtain the Lagrangian for a charged particle moving in an electromagnetic field

18. Obtain the lagrangian equation for a spherical pendulum.

(6×2=12)

### Part C

*Answer any two questions.*

*Each question carries 5 weights.*

19. What is Hamilton's principle? Obtain Lagrange's equations from Hamilton's principle using the calculus of variation.

20. Obtain the Lagrange's equations for small oscillations of a system of two coupled oscillators in the neighborhood of stable equilibrium. Obtain the normal modes and the normal co-ordinates.

21. Discuss the precessional motion with and without nutation of a spinning symmetrical top under gravity.

22. Derive Einstein's field equations. (ii). Write a note on gravitational red shift.

(5×2=10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**

**Second Semester**

**Faculty of Science**

**Physics- Material Science**

**PH020201: APPLIED MATHEMATICS FOR PHYSICS – II**

**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. If  $f(z) = \sin z$ , show that  $f^*(z) = f(z^*)$  for complex  $z$ .
2. Check whether  $f(z) = i^z$  is analytic.
3. Explain cyclic group with example.
4. Prove that inverse of any element of group is unique.
5. Write down two partial differential equations and their relevance in physics.
6. Write short note on the different boundary conditions employed to solve differential equations.
7. Obtain the Laplace transform of  $f(x) = x^n$
8. Define the Fourier transform of a function  $f(x)$ . What is the Fourier transform of its first derivative?
9. What is meant by Earth's Nutation?
10. Explain SU (3) flavor symmetry and SU(3) colour symmetry.

(8 x 1 = 8)

## Part B

Answer any **six** questions.

Each question carries 2 weights.

11. Evaluate  $\int_C \frac{2z-1}{(z+1)(z+3)} dz$ , where C is  $|Z| = 2$  using Residue Theorem.
12. Obtain the Laurent expansion of the function  $f(z)$  about  $z = z_0$ .
13. Show that the Fourier transform of a Gaussian function is another Gaussian.
14. Prove that the set of all matrices  $\begin{pmatrix} \sin\theta & \cos\theta \\ -\cos\theta & \sin\theta \end{pmatrix}$  for  $0 \leq \theta \leq 2\pi$  form a Lie group.
15. State and prove convolution theorem of Laplace transforms.
16. Separate the partial differential equation  $\nabla^2 \psi(\rho, \phi, z) + k^2 \psi(\rho, \phi, z) = 0$  in to three ordinary differential equations.
17. Obtain the momentum representation of a wave function  $\psi(x) = \sqrt{a} \exp(-x^2/2a^2)$ .
18. Obtain a general solution of Laplace equation in circular cylindrical co-ordinates.

(6 x 2 = 12)

## Part C

Answer any **two** questions.

Each question carries 5 weights.

19. State and prove Cauchy's integral theorem. Deduce Cauchy's integral formula from it.
20. State Schur's lemmas and prove the great Orthogonality theorem.
21. Solve the differential equation for the electric charge in a series LCR circuit using Laplace transform.
22. Solve Poisson's Equation using Green's function.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Second Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH020202: ELECTRODYNAMICS AND ELECTROMAGNETIC**  
**WAVES**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Write a short note on Maxwell's stress tensor.
2. State and explain second uniqueness theorem.
3. Why TEM wave cannot propagate through a wave guide?
4. Show that the four dimensional divergence of current density 4- vector is divergenceless.
5. Discuss the significance of Jefimenko's Equations.
6. What is meant by gauge transformation?
7. Write a short note on radiation reaction.
8. What is meant by dispersion in dielectrics?
9. Define proper velocity and proper time.
10. Obtain the expression for momentum of monochromatic plain waves.

(8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. From Maxwell's equations obtain wave equation for an electromagnetic field.  
Identify the velocity of propagation.
12. Prove that dipole moment is independent of choice of origin if total charge of the system is zero.
13. For a TM wave between parallel plate, find the expression for cut off frequency.

14. A pion at rest decays into a muon and a neutrino. Find the energy of outgoing muon in terms of 2 masses,  $m_\pi$  and  $m_\mu$ , (assume  $m_\nu=0$ ).
15. Obtain an expression for the fields of a moving point charge.
16. Show that  $E^2 - c^2 B^2$  is relativistically invariant.
17. Show that when a uniform plane wave propagates in a good conductor, the magnetic field lags electric field by  $45^\circ$ .
18. Prove that  $R + T = 1$  for a wave incident normally on a boundary separating two media.

(6 x 2 = 12)

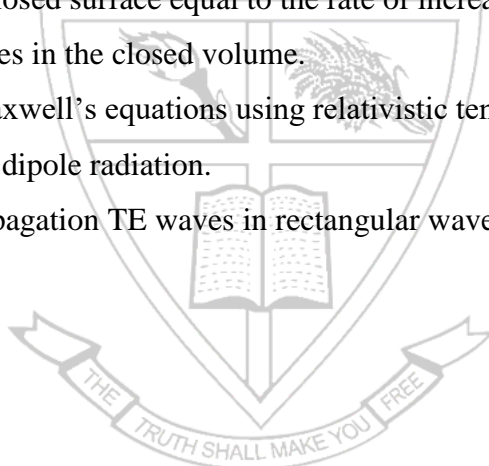

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. What is Poynting vector? Show that for a lossless medium, the total power flowing into a closed surface equal to the rate of increase of electric and magnetic energies in the closed volume.
20. Reformulate Maxwell's equations using relativistic tensor notation of fields.
21. Explain electric dipole radiation.
22. Explain the propagation TE waves in rectangular waveguide.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Second Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH020203:ADVANCED ELECTRONICS AND**  
**COMMUNICATION**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Do we get a voltage follower with inverting amplifier? Explain.
2. Explain slew rate.
3. Explain the working of zero crossing detectors.
4. Distinguish between FET and JFET.
5. Explain the performance of a summing amplifier.
6. Discuss balanced modulator.
7. Explain the fundamental principle of VCO with a diagram.
8. Give the effect of variation in power supply voltage on offset voltage.
9. What determines peaking frequency in the peaking amplifier?
10. Explain the frequency response of an op-amp.

(8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Draw and explain the operation of a triangular wave generator.
12. Calculate the exact voltage gain of a negative voltage series feedback OP-AMP circuit from the following data. Open loop voltage gain = 1000, feedback resistor,  $R_F = 22K$ , and series resistor  $R_1 = 1K$ .

13. The CMRR of an OP-AMP is rated at 80db. If its common mode gain is measured as 0.5, calculate the o/p corresponding to a differential input of  $10\mu\text{V}$ .
  14. What are the different types of pulse modulation? Explain with waveforms, how it is derived from PWM.
  15. Explain how sinusoidal waves are generated in an OP-AMP Wien bridge oscillator circuit.
  16. Briefly explain the working of an integrator.
  17. Briefly explain voltage series feedback in op-amps.
  18. What are the applications of IC565PLL
- (6 x 2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. What is frequency modulation? Explain FM generation and detection.
20. Draw the two differential amplifier configurations based on the no of Op-Amps used. Calculate the voltage gain, input resistance, output resistance of a differential amplifier using any of the two configurations.
21. Discuss closed loop frequency response of an Op-Amp and briefly explain circuit stability.
22. Explain the action of a low – pass first order Butterworth filter. How it is converted into a second order filter? Draw the frequency response curves.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Second Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH020204: ADVANCED NUCLEAR PHYSICS**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. What are quarks? Name the different flavours of quarks.
2. Distinguish between leptons and hadrons.
3. The binding energy per nucleon is low at low mass numbers and high mass numbers. Explain.
4. Explain the ground state of deuteron. Plot the wave function for the deuteron ground state taken as an S-state.
5. Express the Gell-mann-Nishijima formula.
6. What are isomeric transitions?
7. Explain Q value of nuclear reaction.
8. Give the selection rule for forbidden decays.
9. What are power reactors?
10. What are magic numbers? What are singly and doubly magic nuclei. List magic numbers below 100.

(8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. The ground state of  ${}_{55}\text{Cs}^{137}$   $7/2^+$  decays with a half life 33 years, 92% by  $\beta$  emission to an excited state of  ${}_{56}\text{Ba}^{137}$  (which in turn decays by  $\gamma$  emission with half life 2.6 minutes to the ground state  $\text{Ba}^{137}$ ) and 8% by  $\beta$  emission directly to the ground

state. Following quantities were measured  $(K.E)_{\beta\max}(92\%)=0.51\text{MeV}$   $(K.E)_{\beta\max}(8\%)=1.17\text{MeV}$  What is the degree of forbiddenness of each transition?

12. How many  $\alpha$  and  $\beta$  particles are emitted when  ${}_{92}\text{U}^{238}$  decay to Lead ( ${}_{82}\text{Pb}^{206}$ ).

13.  ${}^7\text{Li}$  ( $Z=3$ ) and  ${}^7\text{Be}$  ( $Z=4$ ) have the atomic masses 7.016005 and 7.016929u. Which of them shows  $\beta$  activity and of what type? Calculate  $Q$  for it.

14. Find the energy release of two  ${}_1\text{H}^2$  nuclei can fuse together to form  ${}_2\text{He}^4$  nucleus. The binding energy per nucleon of  $\text{H}^2$  and  $\text{He}^4$  is 1.1MeV and 7.0 respectively.

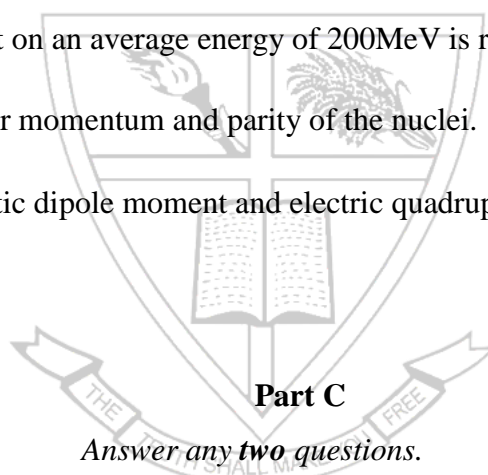

15. Show that nuclear density of  ${}_1\text{H}^1$  is about 1014 times greater than atomic density assume the atom have the radius of the first Bohr model.

16. A reactor is developing energy at the rate of 1500KW. How many atoms of  $\text{U}^{235}$  undergo fission per second? How many Kg of  $\text{U}^{235}$  would be used in 1000 hours of operation assuming that on an average energy of 200MeV is released per fission.

17. Describe the angular momentum and parity of the nuclei.

18. Explain the magnetic dipole moment and electric quadrupole moment of the nuclei..

(6 x 2 = 12)

### Part C

Answer any **two** questions.

Each question carries 5 weights.

19. Describe Fermi theory of  $\beta$  decay. Calculate the energy release in  $\beta$  decay process.

20. Explain electric quadrupole moment for an ellipsoidal charge distribution.

21. Describe quark model of elementary particles.

22. What is the evidence for shell structure of the nucleus? Sketching the main assumptions, explain the shell model of the nucleus.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**

**Third Semester**

**Faculty of Science**

**Physics- Material Science**

**PH020301: STATISTICAL PHYSICS AND ASTROPHYSICS**

**(2025 admission onwards)**

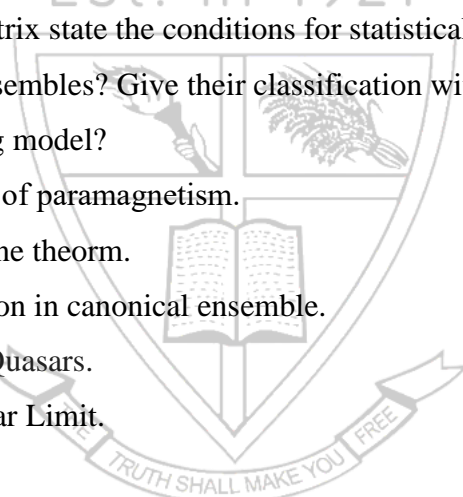

Time : 3 Hours.

Maximum Weight : 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

- 
1. In terms of density matrix state the conditions for statistical equilibrium.
  2. What are statistical ensembles? Give their classification with suitable examples.
  3. What is meant by Ising model?
  4. Discuss Pauli's theory of paramagnetism.
  5. State Wiener Khintchine theorem.
  6. Define partition function in canonical ensemble.
  7. Write a brief note on Quasars.
  8. Explain Chandrasekhar Limit.
  9. What are Magnetars?
  10. What is meant by colour index of a star?

(8x1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. What is Fermi gas? Explain the thermodynamic behavior of an ideal Fermi system.
12. The molar mass of lithium is 0.00694 and its density is  $0.53 \times 10^3 \text{ kg/m}^3$ . Calculate the Fermi energy and Fermi temperature of the electrons.
13. Derive grand partition function. How can you obtain the various thermodynamic quantities from it?

14. Discuss on density and energy fluctuations in the grand canonical ensemble.
15. Discuss the phenomenon of Bose Einstein condensation in momentum space and hence explain the properties of liquid He-II.
16. Explain the two main processes behind the energy generation in stars.
17. Explain Virial theorem.
18. Define luminosity of a star. Derive the relationship between the luminosity and absolute magnitude. Derive relation between entropy and canonical partition function.

(6x2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights*

19. What is Bragg William approximation. How energy equation of Ising model is expressed in this approximation
20. Explain the thermodynamics of an ideal gas in canonical ensemble
21. Explain Saha's equation of thermal ionization and its applications.
22. Explain Hertz Sprung Russell diagram.

(2 x 5 =10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Third Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH020302: NUMERICAL METHODS IN PHYSICS**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Discuss the uses of Lagrange's interpolation formula.
2. What do you mean by truncation error?
3. Why Trapezoidal rule is called so?
4. Explain Gauss – Seidel method for solution of Laplace equation.
5. What do you mean by marching methods for the solution of ordinary differential equations?
6. What is the basic idea behind predictor-corrector methods?
7. How will you find the inverse of a matrix by Gauss – Jordan method?
8. Obtain finite difference approximation to derivatives.
9. Show that divided differences are symmetrical in their arguments.
10. Write a note on Milne's method. (8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Using Romberg's method, compute  $I = \int_0^1 \frac{1}{1+x} dx$  correct to 3 decimal places.
12. Given  $\frac{dy}{dx} = y - x$ , with  $y(0)=2$ . Find  $y(0.1)$  and  $y(0.2)$  correct to 4 decimal places.
13. The following data gives the melting point of an alloy of lead and zinc

% of lead in the alloy	40	50	60	70	80
Temperature in °C	201	206	225	251	276

Find the melting point of the alloy containing 48% of lead using Newton's forward Interpolation formula

14. Find the Lagrange's interpolation polynomial of degree 2 approximating the function  $y=\ln(x)$  defined by the following table of values. Hence find the value of  $\ln(2.7)$ .

15. Solve the differential equation  $(1+x)\frac{dy}{dx} + y = 0$  with  $y(0) = 2$  for  $x = 1.5$  to  $x = 2.5$  using fourth order Runge – Kutta method with  $h = 0.25$ .

16. Solve the following system of equations by Gauss elimination method

$$10x + y + z = 12$$

$$x + 10y + z = 12$$

$$x + y + 10z = 12$$

17. Solve one dimensional heat equation

$$U_t = U_{xx}$$

with the conditions  $U(x, 0) = x^2 - 4x, 0 \leq x \leq 4, U(0, t) = 0, U(4, t) = 0$  using Schmidt formula.

18. Find the equation of least square that fit a line  $y = a_0 + a_1x$  for the following data.

X	5	10	15	20	25
Y	16	19	23	26	30

(6 x 2 = 12)

### Part C

Answer any *two* questions.

Each question carries 5 weights.

19. Explain the method of least square curve fitting. How can you fit a straight line and an exponential function to given data points.

20. Describe Milne's method. Given

$$y' = 1 + y^2$$

with  $y(0)=0$ . Find  $y(0.8)$  and  $y(1.0)$ .

21. Explain numerical double integration. Use trapezoidal rule to evaluate

the double integral

$$\int_{-2}^2 \int_0^4 (x^2 - xy + y^2).$$

22. Solve by Crank – Nicolson method

$$u_t = 2u_{xx}$$

subject to conditions  $u(x,0) = \sin\pi x, 0 \leq x \leq 1$  and  $u(0,t) = 0, u(1,t) = 0, t$

$> 0$ . With  $h = 1/4$  and  $k = 1/16$ , compute  $(1/2, 1/8)$ .

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Third Semester**  
**Faculty of Sciences**  
**Physics – Material Science**  
**PH020303: ADVANCED QUANTUM MECHANICS**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. What is Noether's theorem and its consequences?
2. Write down the properties of Dirac matrices  $\gamma$ .
3. Discuss bilinear co variants in Dirac's theory.
4. Discuss the probability conservation and its importance in relativistic quantum mechanics.
5. What is the resonance scattering? Give an example.
6. Define scattering length. How it is related to zero energy cross section?
7. Discuss Ramsaur-Townsend effect.
8. What are the shortcomings of Klein-Gordon equation?
9. Describe Fermi's golden rule.
10. Distinguish between interaction picture and Schrodinger picture.

(8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. What is non relativistic limit of Dirac equation? Explain the various terms.
12. In relativistic quantum mechanics, derive the approximate Hamiltonian for an electrostatic problem.
13. Discuss the bound state problem of deuteron.
14. Obtain the relation between scattering amplitude and differential cross section.
15. Discuss sudden and adiabatic approximation with an example.
16. Establish the formula for expanding plane wave in terms of partial waves.
17. Explain Electric Dipole Approximation.
18. Explain Optical Theorem.

(6 x 2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. What is transition probability? Obtain an expression for total transition probability in case of constant perturbation.
20. Derive the expression for scattering amplitude using Born approximation.
21. Derive the nonrelativistic limit of Dirac equation.
22. Derive the second quantization of the free electromagnetic field.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**

**Fourth Semester**

**Faculty of Science**

**Physics- Material Science**

**PH020401: ATOMIC AND MOLECULAR SPECTROSCOPY**

**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight:30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. What is the importance of Lande g factor?
2. How hyper fine structure is obtained in atomic spectra?
3. The intensity of  $J=0 \rightarrow J=1$  is often not the most intense rotational line. Why?
4. What are Fortrat parabolae?
5. Briefly explain the hot bands in IR spectra.
6. Explain inverse Raman scattering.
7. Intense light sources are needed for the observation of nonlinear Raman effects. Why?
8. Explain Frank-Condon Principle.
9. What is the significance of Bloch equations in NMR spectroscopy?
10. How s-electron density is related to chemical isomer shift?

(8×1=8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Calculate the Doppler velocity corresponding to the natural line width of the  $\gamma$ -ray emission line from 23.9 keV excited state of  $^{119}\text{Sn}$  nucleus having a half life of  $1.9 \times 10^{-8}\text{s}$ .
12. Discuss the theory of stark effect in one electron system.
13. The moment of inertia of the CO molecule is  $1.46 \times 10^{-46} \text{ Kg m}^2$ . Calculate the

energy and angular velocity in the lowest rotational energy level of the CO molecule.

14. The Raman line associated with a vibrational mode which is both Raman and Infrared active is found at  $4600\text{\AA}^0$  when excited by light of wavelength  $4358\text{\AA}^0$ . Calculate the wavelength of the corresponding infrared band.
15. Define chemical shift with example. Distinguish between  $\delta$  and  $\tau$  chemical shift.
16. The limit of continuum absorption for iodine occurs at 499.5 nm. What is the energy of dissociation of iodine into one normal and one excited atom? Calculate the dissociation energy of iodine molecule into normal atoms, if the lowest excitation energy is 0.94 eV.
17. Describe the theory of ESR and explain the origin of hyperfine structure with one example?
18. Define chemical shift with example. Distinguish between  $\delta$  and  $\tau$  chemical shift.

(6×2=12)

Est. in 1921

### Part C

Answer any **two** questions.

Each question carries 5 weights.

19. Explain the theory of anomalous Zeeman effect. Discuss under what condition  
Zeeman effect changes to Paschen- back effect
20. Discuss rotational spectra of a non-rigid rotator.
21. What are the informations one can get from a vibrational analysis of an electronic vibration spectra. Explain it with Deslandres table.
22. Describe the spin –spin and spin –lattice relaxation processes with theory.

(5×2=10)

GROWTH TECHNIQUES**

**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight: 30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. What is Nucleation? Write different types of nucleation.
2. Write a note on Epitaxy.
3. Explain the principle of diffusion pump.
4. Explain Zone melting in crystal growth process.
5. What are the merits of Bridgeman technique?
6. Explain the working of Gaede's rotary oil pump.
7. Write different optical methods for thin film thickness measurements.
8. Explain different techniques for thin film growth under chemical vapor deposition.
9. Explain the criteria for vapor transport mechanism.
10. Give the principle of Pulsed Laser deposition.

(8x1= 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. What is Pirani gauge? Explain its construction and working.
12. Discuss the spectrometric method of measuring the thickness of a film.
13. Explain Verneuil's flame fusion technique.
14. Write about the growth of ADP crystals.
15. Explain the Langmuir theory for Physical vapor deposition technique.

16. Differentiate between flash evaporation and arc evaporation techniques.
17. Calculate the thickness of Silicon dioxide thin film having film reflectance of 4 maxima and minima; refractive index 2 uses a photometric method? ( Given the wave length of light is  $1\mu\text{m}$ )
18. Explain the working of piezoelectric thickness monitor arrangement
- (6x 2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. Explain the morphological, structural and optical properties of thin films.
20. Explain Czocharalski method for crystal growth technique.
21. Discuss different sputtering methods for deposition of thin films.
22. Discuss the hydrothermal growth of crystals.

(2 x 5 = 10)

Time: 3 Hours

Maximum Weight:30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. List out four challenges faced by Nanotechnology.
2. What is the likely impact of nanotechnology?
3. Describe the optical properties of Semiconducting Nanoparticles.
4. What are Metalnanoclusters?
5. Explain the concept of environmental TEM.
6. What is a Scanning transmission electron microscopy?
7. Briefly explain fullerenes and fullerene-derived crystals.
8. What is the significance of Nano manipulation?
9. Explain the Mechanism of scanning probe lithography.
10. Write a note on magnetic nanostructures.

(8×1=8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. What are the general issues of concern of synthesis of Nanomaterial?
12. With suitable diagram explain the processes Solvothermal synthesis of nanoparticles.
13. Explain the process of exciton confinement in quantum dots.
14. Describe the mechanism of band gap engineering and optical response.
15. How can the electron diffraction pattern be indexed?

16. Explain the working of Scanning probe lithography and also mention its advantages.
  17. Explain the properties of ordered mesoporous structures and random mesoporous structures.
  18. Describe the Lithography Concepts of nanotechnology and its application.
- (6×2=12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. Explain the Quantum mechanics of low dimensional systems and confined nanoclusters.
20. Discuss the structure, principle, and working of Scanning Electron Microscopy (SEM).
21. Explain the properties of metal-polymer nanocomposite structures.
22. Describe the Mechanism of molecular transport and its advanced application.

*Each question carries 1 weight.*

1. Distinguish between ceramics and polymers.
2. What is a Burgers vector?
3. What is the difference between atomic mass and atomic weight?
4. What is meant by self-diffusion?
5. Write the difference between isotropy and anisotropy
6. What is isomerism?
7. What is the difference between Frenkel defect and schottky defect?
8. What is modulus of elasticity?
9. What are refractories?
10. What is graphite?

(8 x 1 = 8)

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. Copper has an atomic radius of 0.128 nm ( $1.28\text{\AA}$ ), an FCC crystal structure, and an atomic weight of 63.5 g/mol. Compute its theoretical density.
12. Briefly explain the different structures of polymer molecule.
13. Distinguish between Thermoplastic and Thermosetting Polymers.
14. Calculate the equilibrium number of vacancies per cubic meter for copper at  $1000^{\circ}\text{C}$ . The energy for vacancy formation is 0.9 eV/atom; the atomic weight and density (at  $1000^{\circ}\text{C}$ ) for copper are 63.5 g/mol and  $8.40\text{ g/cm}^3$ , respectively.
15. Explain the mechanical behaviour of ceramic materials.

16. Compute the strain-hardening exponent  $n$  in Equation 7.19 for an alloy in which a true stress of 415 MPa (60,000 psi) produces a true strain of 0.10; assume a value of 1035 MPa (150,000 psi) for  $K$ .
17. Distinguish between ferrous and nonferrous alloys.
18. Explain tear strength and hardness of polymers.

(6 x 2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. Explain the different types of bonding in materials.
20. Briefly explain the various defects in solids.
21. Discuss the various diffusion mechanisms. What are the factors affecting it?
22. Briefly explain the mechanical behavior of metals.

(2 x 5 = 10)

**Bunch B: Material Science - II**  
**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Third Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH850301: Optoelectronics**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight:30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Explain Acousto optic effect.
2. Explain Pockel effect.
3. What is meant by Bit rate?
4. Differentiate Surface and Edge emitting LEDs.
5. Explain Laser diode equation.
6. Explain Photo voltaic characteristics.
7. Explain Normalised index difference.
8. Explain V Number of an optical fiber.
9. Explain Dispersion flattened fibres.
10. Explain Ramo's theorem.

**(8×1=8)**

**Part B**

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. A step index fiber has a core diameter of 100 $\mu\text{m}$  and a refractive index of 1.480. The cladding has a refractive index of 1.460. calculate numerical aperture, acceptance angle and V number.
12. Calculate the maximum length of an optical fiber whose input power is 1mW and produces an output power of 1 nW with an attenuation coefficient of 0.4 dB km<sup>-1</sup>.

13. What is the conductivity of an n type Si crystal that has been doped uniformly with  $10^{16} \text{ cm}^{-3}$  phosphorus atoms if the drift mobility of electrons is about  $1350 \text{ cm}^2 \text{V}^{-1} \text{s}^{-1}$ .
14. A typical low power 5mW He Ne Laser operates at a dc voltage of 2000 V and carries a current of 7 mA. What is the efficiency of the Laser?
15. A Si pin photodiode has an active light receiving area of diameter 0.4 mm. When radiation of wavelength 700nm and intensity  $0.1 \text{ mW cm}^{-1}$  is incident it generates a photocurrent of 56.6 nA. What is the responsivity and QE of the photodiode at 700 nm?
16. Calculate the slope efficiency of a laser diode operating at 1300 nm, if its external quantum efficiency is 0.1.
17. Estimate the minimum detectable power of a PIN diode whose responsivity and dark current are  $0.5 \text{ A/W}$  and  $1 \text{ nA}$  respectively.
18. A GaAs LED has an effective recombination region of width  $0.1 \mu\text{m}$ . If it is operated at a current density of  $2 \times 10^7 \text{ Am}^{-2}$  estimate the modulation bandwidth that can be expected?

(6×2=12)

### Part C

Answer any **two** questions.

Each question carries 5 weights.

19. Write a short note on Quantum well lasers and Optical Laser amplifiers.
20. Explain dispersion in single mode fibers.
21. Explain the detection process in Photo conductive detection.
22. Explain the principle and working of Electro optic modulator.

(5×2=10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Fourth Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH850402: SEMICONDUCTOR DEVICES**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight:30

**Part A**

*Answer any **eight** questions.*

*Each question carries 1 weight.*

1. Write the equation for the total drift current density.
2. State the definition of the quasi-Fermi level for electrons.
3. What is two dimensional electron gas? Explain.
4. Write the characteristics of heterojunction materials.
5. Sketch the electron and hole currents through a forward-biased pn junction diode.
6. What is the cutoff frequency of a bipolar transistor?
7. Obtain the IC technology for resistor formation
8. What is the relation between barrier height, work function and semiconductor electron affinity?
9. Describe the response of a bipolar transistor when it is switching between saturation and cutoff.
10. Write a short note on epitaxial growth.

(8 x 1 = 8)

**Part B**

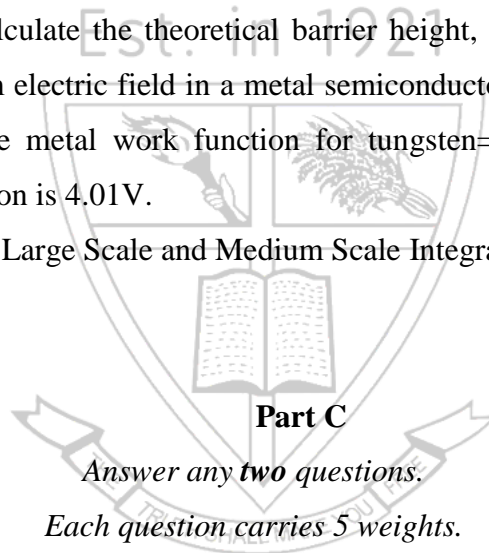

*Answer any **six** questions.*

*Each question carries 2 weights.*

11. What is meant by a short diode?
12. Explain emitter current crowding of bipolar transistor.
13. A uniformly doped n-type silicon epitaxial layer of  $0.5\Omega\text{-cm}$  resistivity is subjected to boron diffusion with constant surface concentration of  $5 \times 10^{18}\text{cm}^{-3}$

- <sup>3</sup>. It is desired to form a p-n junction at a depth of  $2.7\mu\text{m}$ . At what temperature should this diffusion be carried out if it is to be completed in 2hr?
14. Compare the forward-biased current-voltage characteristic of a Schottky barrier diode to that of a pn junction diode.
15. Sketch the cross section of a diode pair integrated circuit using collector – base region if (a) the cathode is common and (b) the anode is common.
16. Consider n-type Ge doped with  $N_d=10^{16}\text{ cm}^{-3}$  and P-type GaAs doped with  $N_a=10^{16}\text{ cm}^{-3}$ . Let  $n_i=2.4 \times 10^{13}\text{ cm}^{-3}$  for Ge at  $T=300\text{ K}$ . Determine the difference between two conduction band energies ( $\Delta E_c$ ), difference between two valence band energies ( $\Delta E_v$ ) and the total built in potential barrier  $V_{bi}$  for an n-Ge to p-GaAs heterojunction using the electron affinity rule.
17. Consider a contact between tungsten and n-type silicon doped to  $N_d=10^{16}\text{ cm}^{-3}$  at  $T=300\text{K}$ . Calculate the theoretical barrier height, built in potential barrier and a maximum electric field in a metal semiconductor diode for zero applied bias. Given, the metal work function for tungsten =  $4.55\text{V}$  and the electron affinity for silicon is  $4.01\text{V}$ .
18. Write a note on Large Scale and Medium Scale Integration.

(6 x 2 = 12)

19. Derive the Ambipolar Transport Equation.
20. Explain Ebers-Moll Model of bipolar transistor.
21. Bring out the energy band diagram of heterojunction material and discuss the two dimensional electron gas.
22. Discuss in detail the fabrication of an integrated circuit.

(2 x 5 = 10)

**MAHATMA GANDHI UNIVERSITY**  
**PG-CSS PHYSICS MODEL QUESTION PAPER**  
**Fourth Semester**  
**Faculty of Science**  
**Physics- Material Science**  
**PH850403: CERAMICS AND BIO MATERIALS**  
**(2025 admission onwards)**

Time: 3 Hours

Maximum Weight:30

**Part A**

*Answer any **eight** questions.*  
*Each question carries 1 weight.*

1. Explain the structure of a non-oxide ceramics.
2. What is the mechanism behind diffusion in ionic solids?
3. Write down the difference between Ferroelectrics and Piezoelectric
4. What are the significances of Electro-optic ceramics
5. What do you mean by Giant magneto-resistance
6. What are important feature of Magnetic ceramics
7. Explain the principle of protein folding.
8. Write down the major difference in DNA and RNA
9. What are the application of Raman spectroscopy in bioscience
10. Describe the phoneme of magnetic resonance imaging

(8x1= 8)

**Part B**

*Answer any **six** questions.*  
*Each question carries 2 weights.*

11. Write a note on ionic conductivity in ceramics.
12. Explain the use of Dielectric materials for microwave application.
13. Describe the Thermodynamic formulation of ferroelectrics.
14. Discuss the principle of superconductivity and their applications to high field magnets.
15. What is a Magneto-electronic materials and explain its characteristics?
16. Explain the structure of DNA with neat diagram.
17. Write a note on energy and entropy in complex biomolecules.
18. Explain the working of Transmission electron microscope with a schematic diagram

(6x 2 = 12)

### Part C

*Answer any **two** questions.*

*Each question carries 5 weights.*

19. Explain the frequency dependence of polarization and associated mechanism in electronic ceramics.
20. Describe the Microstructure - property relationships, Applications of piezoelectric materials in transducers
21. Write an essay on molecular modeling of biological problems
22. Explain the principle and working of Nuclear magnetic resonance spectroscopy in Bio materials.

(2 x 5 = 10)

## **CHAPTER-V**

### **MODEL QUESTION PAPERS**

**M.Sc PHYSICS DEGREE C.S.S EXAMINATION**  
**1 Semester**  
**Faculty of Science**  
**PH010101 – MATHEMATICAL METHODS IN PHYSICS – I**  
**(2025 Admissions Onwards)**

**Time : 3 Hrs**

**Max Weight : 30**

#### **SECTION – A**

**(Answer Any Eight Questions. Each Question Carries a Weight of 1)**

1. State and Prove Gauss' divergence theorem
2. What is similarity transformation? How does it affect the eigen values and eigen vectors of a matrix?
3. State and prove Cayley – Hamilton Theorem for square matrices
4. Explain the central limit theorem.
5. Show the Kronecker delta is a mixed tensor of rank 2.
6. State the theorem relating line and surface integrals.
7. What are orthogonal curvilinear co-ordinates?
8. Show that the eigenvalues of Hermitian matrix are orthogonal to each other
9. Explain contra variant and covariant tensors
10. What are Christoffels 3 index symbols? (8 x 1 = 8)

#### **SECTION – B**

**(Answer Any Six Questions. Each Question Carries a Weight of 2)**

11. Solve the system of equations
$$\begin{aligned}x+y+3z &= 6 \\ 2x+3y-4z &= 6 \\ 3x+2y+7z &= 0\end{aligned}$$
12. Show that contraction reduces the rank of a tensor by 2?

13. Discuss the properties of Dirac delta function
14. Discuss Schwartz inequality
15. Define Christoffel symbols of first and second kind
16. Show that in Cartesian co-ordinate system contra variant covariant components of a vector are identical.
17. Discuss the features of linear vector space.
18. Explain Associate Tensors?

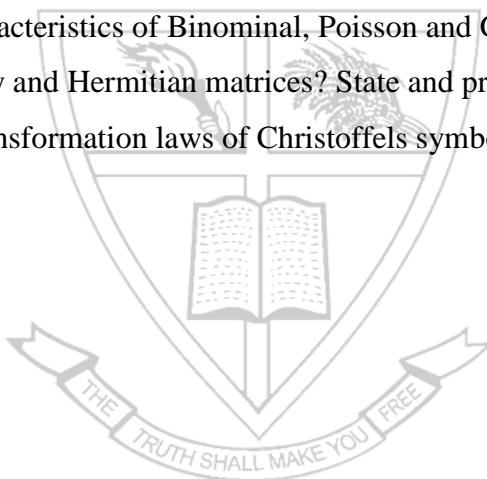

(6 x 2 = 12)

### SECTION – C

**(Answer Any Two Questions. Each Question Carries a Weight of 5)**

19. Define general orthogonal curvilinear co-ordinates and obtain various differential operators in terms of orthogonal curvilinear co-ordinates
20. Outline the characteristics of Binomial, Poisson and Gaussian distributions
21. What are unitary and Hermitian matrices? State and prove their properties
22. Bring out the transformation laws of Christoffel symbols.

(2 x 5 = 10)

MODEL QUESTION PAPER  
M.Sc. DEGREE (PGCSS0EXAMINATION  
FIRST SEMESTER  
FACULTY OF SCIENCE  
Branch II: Physics(A ) Pure Physics

**(2025 Admissions Onwards)**  
**PH010102 – CLASSICAL MECHANICS**

Time: 3 hours

Maximum Weight: 30

**PART A**

(Answer any **EIGHT** questions. Each question carries **1** weight)

1. Discuss the effect of holonomic constraints on the number of degrees of freedom of a system.
2. What is dissipation function? Give its physical significance.
3. State Noether's theorem.
4. Explain how the Hamiltonian of a system can be generated from its Lagrangian using Legendre transformation.
5. Distinguish between stable equilibrium and unstable equilibrium.
6. Write down the fundamental Poisson brackets.
7. What are the first integrals of a conservative central potential?
8. Explain centrifugal potential in the context of a central force field.
9. Define principal moments of inertia of a rigid body.
10. Explain Thomas precession.

**(8 X 1 = 8)**

**PART B**

(Answer any **SIX** questions. Each question carries **2** weight)

11. A bead is sliding on a wire in a uniformly rotating wire in a force free region. The wire is straight and the axis of rotation of the wire is perpendicular to the wire. Obtain the equation of motion of the bead.
12. Derive Hamilton's equations of motion from modified Hamilton's principle.

13. A simple pendulum has a bob of mass  $m$  with another mass  $m'$  at the moving support. Mass  $m'$  moves on a horizontal line in the vertical plane containing the bob of the pendulum. Find the normal frequencies and normal modes of vibrations.
14. Show that the transformation  $Q = \sqrt{2q} \cos p$ ,  $P = \sqrt{2q} \sin p$  is canonical.
15. Solve the problem of simple harmonic oscillator in one dimension by making use of a canonical transformation.
16. State and prove Poisson's theorem regarding Poisson brackets.
17. A particle falls freely from a height  $h$  at a place with latitude  $\lambda$ . Find the deflection due to Coriolis force.
18. Explain the physical significance of Hamilton's principal function.

(6 X 2 = 12)

### PART C

(Answer any **TWO** questions. Each question carries 5 weight)

19. Derive Lagrange's equations of motion from Hamilton's principle.
20. Discuss the normal modes and normal coordinates of the free vibrations of  $\text{CO}_2$  molecule.
21. Derive Euler's equation for rigid body motion. Apply it to work out the torque free motion of a symmetric top.
22. Describe how action-angle variable can be used to obtain the frequencies of a periodic system without finding a complete solution to the motion of the system. Apply this method to the linear harmonic oscillator problem.

(2 X 5 = 10)

MODEL QUESTION PAPER  
M.Sc. DEGREE (PGCSS0) EXAMINATION  
SECOND SEMESTER  
FACULTY OF SCIENCE  
Branch II: Physics(A ) Pure Physics

**PH010202 – QUANTUM MECHANICS-I**

Time: 3 hours

Maximum Weight: 30

**PART A**

(Answer any **EIGHT** questions. Each question carries **1** weight)

1. Discuss the concept of kets and bras.
2. Show that the outer product of a ket and bra is an operator.
3. What is meant by a Hermitian operator?
4. Define time evolution operator
5. What are energy eigenkets? Why are they called stationary states?
6. State and explain the Ehrenfest's theorem.
7. Give the fundamental commutation relations for angular momentum operators.
8. Write down the rotation operator for a spin half system.
9. Give the matrix elements of  $J_x$  and  $J_y$  in  $|jm\rangle$  basis.
10. Express the  $L_z$  operator in spherical polar coordinate system.

**(8 X 1 = 8)**

**PART B**

(Answer any **SIX** questions. Each question carries **2** weight)

11. Obtain the matrices representing the three components of spin operator in  $S_z$  basis.
12. Show that (a) a change of basis can be accomplished by a unitary transformation. (b) Unitary equivalent observables have identical spectra.
13. Express infinitesimal translation operator in terms of momentum operator. Hence deduce the commutation relation between position and momentum operators.
14. Show that the wavefunctions in momentum space and position space are Fourier transforms of each other.

15. Solve the Schrodinger equation for the time evolution operator for a system with a time independent Hamiltonian.
16. The lifetime of hydrogen in the 2p state to decay to the 1s ground state is 1.6 ns. Calculate the spread in energy of this excited state . Also estimate the linewidth of the emitted spectral line in angstroms.
17. Calculate the commutation relations between all the three pairs of Pauli spin matrices.
18. Calculate the Clebsch-Gordon coefficients associated with the addition of two angular momenta  $j_1 = 1/2$  ;  $j_2 = 1/2$  .

**(6 X 2 = 12)**

### **PART C**

(Answer any **TWO** questions. Each question carries 5 weight)

19. State and prove the generalized uncertainty principle.
20. Obtain the energy eigenvalues and energy eigenkets of a simple harmonic oscillator using operator method.
21. Using ladder operators, solve the eigenvalue problem for angular momentum operators.
22. Starting from the Schrodinger equation for a spherically symmetric potential, obtain the energy eigenvalues and the eigenfunctions of the hydrogen atom. Discuss the degeneracy of the energy levels of the hydrogen atom.

**(2 X 5= 10)**

**M Sc (Physics) Degree (C.S.S) Examination,**  
**First Semester**  
Faculty of Science  
**Course Code- PH010103: ELECTRODYNAMICS**

(2025 admissions onwards)

Time: Threehours

Max. Weight: 30

**Section- A**

(Answer any **eight** questions. Each question carries a weight of 1)

1. What are the static and dynamic Maxwells equations?
2. What is meant by Maxwells stress tensor? Explain its significance.
3. Why TEM waves can not be transmitted through hollow waveguides?
4. Explain the term characteristic impedance.
5. What is skin depth? How it is related to the attenuation constant?
6. Distinguish between phase velocity and group velocity
7. What is meant by electric dipole radiation?
8. What is a four vector? Give the components of momentum four vector.
9. Explain proper time and proper velocity.
10. What is meant by radiative reaction?

( 8 x 1 = 8 )

**Section B**

(Answer any **six** questions. Each question carries a weight of 2)

11. Verify that the Poynting vector is invariant under the transformation  $\mathbf{E}' = \mathbf{E}\cos\Phi + \mathbf{B}\sin\Phi$  and  $\mathbf{B}' = -\mathbf{E}\sin\Phi + \mathbf{B}\cos\Phi$ . Give the physical significance of the transformation if  $\Phi = \pi/2$
12. Evaluate the magnitude of the current density  $\mathbf{J}$  in a region where the vector potential is given by  $\mathbf{A} = x^2\mathbf{j} - 2xy\mathbf{k}$ , where  $\mathbf{j}$  and  $\mathbf{k}$  are unit vectors.

13. Show that  $\mathbf{E}^2 - \mathbf{B}^2$  is Lorentz scalar.
14. Show that  $\mathbf{E} \cdot \mathbf{B}$  is relativistically invariant.
15. The lowest frequency of an electromagnetic field in a rectangular waveguide is fixed at 3 MHz. What should be the dimension of the waveguide for its propagation?
16. Show that the power radiated from a magnetic dipole varies as the fourth power of the frequency.
17. Explain Gauss law in dielectric medium
18. For a TE in a rectangular wave guide, show that  $TE_{10}$  is the dominant mode

(6 x 2 = 12)

### Section C

(Answer any **two** questions. Each question carries a weight of 5.)

19. Derive the laws of conservation of energy and momentum in electrodynamics and show that the electromagnetic fields carry energy and momentum
20. Discuss the reflection and transmission of the electromagnetic waves at oblique incidence and obtain the Snell's law.
21. Discuss the propagation of TM waves in rectangular wave guide and obtain an expression for the cutoff frequency
22. Explain retarded potentials. Find the expressions for Lienard-Wiechert potentials.

(2 x 5 = 10)

**M.Sc. PHYSICS Degree**

**(C.S.S.) Examination**

**First Semester**

Faculty of Science

**PH010104  
ELECTRONICS**

Time: 3hrs

(2019 admission onwards) Max.Weight:30

**Section A**

**(Answer any *eight* questions. Each question carries a weight of 1)**

1. Why op-amp called operational amplifier?
2. Using neat schematic diagram explain how op-amp can be used as a voltage follower.
3. Discuss current to voltage converter.
4. What are the three methods of compensation?
5. Define slew rate?
6. What is an instrumentation amplifier? Give two applications.
7. What is the principle of phase discriminator?
8. What is a sample and hold circuit? Why is it needed?
9. What is an all pass filter? Where and why is it needed?
10. Write short note on stereo FM reception.

(8 x 1 = 8)

**Section B**

**(Answer any *six* questions. Each question carries a weight of 2)**

11. A 5mv, 1 KHz sinusoidal signal is applied to the input of an OP-AMP integrator for which  $R=100K\Omega$  and  $C = 1\mu F$ . Find the output voltage.
12. Design a Weinbridge oscillator for a frequency of 900Hz.
13. The o/p voltages of a certain OP-AMP circuit changes by 20V in  $4\mu S$ . What is its Slew rate?
14. Design a second order low pass filter at a high cut off frequency of 1 KHz.
15. Differentiate between inverting and non-inverting amplifiers.
16. With the help of diagram bring out the theory of phase-shift oscillator.
17. Discuss an integrator circuit using Op-Amp.
18. What is the Butterworth response? Explain

(6 x 2 = 12)

### Section C

(Answer any *two* questions. Each question carries a weight of 5)

19. Define a filter? How are filters classified? Explain first order low pass butter worth filter. Discuss its frequency response.
20. With neat circuit diagrams explain the principle and operation of a Square wave generator and a triangular wave generator.
21. What is a comparator? Explain its working. Discuss with theory the working of IC 555 as an astable multivibrator.
22. Compare and contrast voltage to frequency and frequency to voltage converters.

(2x 5 =10)

**MODEL QUESTION PAPER**  
**M.SC DEGREE C.S.S EXAMINATION**  
**Semester II**  
**Faculty of Science**  
**PH010201 – MATHEMATICAL METHODS IN PHYSICS – II**  
**(2019 Admissions Onwards)**

**Time : 3 Hrs**

**Max Weight : 30**

**SECTION – A**

**(Answer Any Eight Questions. Each Question Carries a Weight of 1)**

1. What are analytic functions? Explain.
2. State Cauchy residue theorem.
3. Expand  $\ln(1+z)$  in a Taylor series about  $z = 0$
4. What is infinite Fourier sine and cosine transforms?
5. What is meant inverse Laplace transforms?
6. Show that  $P_n(1) = 1$  and  $P_n(-1) = (-1)^n$
7. Study the heat equation
8. Show that  $H_{2n}(0) = \frac{(-1)^n (2n)!}{n!}$
9. Obtain Laplace and Poisson's equations in Cartesian co-ordinates.
10. Write Helmholtz equation. Give any one application (8 x 1 = 8)

**SECTION – B**

**(Answer Any Six Questions. Each Question Carries a Weight of 2)**

11. Show that the real and imaginary parts of the function  $\log z$  satisfy the Cauchy-Riemann equations when  $z$  is not zero.
12. Find the residues of  $f(z) = \frac{ze^{iz}}{z^4 + a^4}$  at its poles.
13. State and prove the convolution theorem.
14. Obtain the Laplace transform of a periodic function with period  $T$ .
15. Explain the method of separation of variables
16. Get the general proof of symmetry property of Green's function.
17. Prove that  $\beta_{1,1} = \frac{1}{2}$

$$\left(-\frac{1}{2}\right) = \pi$$

18. Show that  $\Gamma(m)\Gamma(n) = \Gamma(m+n) \beta(m,n)$  when  $m>0, n>0$  (6 x 2 = 12)

### SECTION – C

**(Answer Any Two Questions. Each Question Carries a Weight of 5)**

19. State and prove Taylor's theorem for a complex function.
20. Discuss the properties of Fourier transform.
21. Bring out Green's function and apply it to scattering problem
22. Define Legendre polynomials and prove their orthogonality condition

(2 x 5 = 10)

QP Code: .....

**M.Sc DEGREE(C.S.S.) EXAMINATION NOVEMBER 2019**

Second Semester

Faculty of Science

**PH010203 -07-STATISTICAL MECHANICS**

(2019 admission onwards)

Time: Three hours

Maximum Weight : 30

**Section A** (Answer any **eight** questions. Each carries weight of 1)

1. Explain the thermodynamic and statistical definitions of entropy.
2. How density of states is related to energy for a 2-D system?
3. Explain Gibb's paradox.
4. Obtain the partition function for a system of harmonic oscillators.
5. "The ensemble average of any physical quantity  $f$  is identical to the value one expects to obtain on making an appropriate measurement on the given system". Justify this statement.
6. Plot F-D distribution function at  $T = 0$  K and  $T > 0$  K.
7. What is meant by chemical potential?
8. Explain Fermi temperature and Fermi energy.
9. Discuss the phase separation in mixtures.
10. What is a maxwell construction for van der Waals isotherms?

**Section B** ( Answer any **six** questions. Each question carries weight of 2,)

11. Making use of the fact that the entropy  $S(N,V,E)$  of a thermodynamic system is an extensive quantity, show that,  $N \left( \frac{\partial S}{\partial N} \right)_{V,E} + V \left( \frac{\partial S}{\partial V} \right)_{N,E} + E \left( \frac{\partial S}{\partial E} \right)_{V,N} = S$
12. For an extreme relativistic gas, the single-particle energy states is given by  $\epsilon(n_x, n_y, n_z) = \frac{hc}{2L} (n_x^2 + n_y^2 + n_z^2)^{1/2}$ , show that,  $C_p/C_v = 4/3$ .
13. Consider a rigid lattice of distinguishable spin 1/2 atoms in a magnetic field. The spins have two states, with energies  $-\mu_0 B$  and  $+\mu_0 B$  for spin up and down respectively. The system is at a temperature  $T$ . Obtain the heat capacity  $C_v$  and schematically plot it as a function of  $T$ .
14. Show that chemical potential is the Gibbs free energy per particle ( $\mu = G/N$ ).
15. Obtain the density matrix for a system of free particles.
16. Show that the entropy of a system in the grand canonical ensemble can be written as  $S = -k \sum_{r,s} P_{r,s} \ln P_{r,s}$ , where  $P_{r,s} = \frac{e^{-\alpha N_r - \beta E_s}}{\sum_{r,s} e^{-\alpha N_r - \beta E_s}}$
17. Derive Clapeyron equation by assuming the Gibbs potential or the chemical potential is same at the phase boundary.
18. Atomic weight of Lithium is  $6.94u$  and density  $0.53 \text{ gm/cm}^3$ . Calculate Fermi energy and Fermi temperature of electrons.

**Part C** ( answer anytwo questions. Each question carries weight of 5, )

19. Derive Liouville's theorem and explain its consequences.
20. Obtain the canonical partition function for system in contact with a thermal reservoir at temperature T.
21. Discuss the density and energy fluctuations in Grand canonical ensemble.
22. Explain the thermodynamic behaviour of an ideal Bose gas.

**M.Sc.PHYSICS Degree (C.S.S) Examination**

Second Semester

Faculty of Science

**PH010204 CONDENSED MATTER PHYSICS**

(2025 admissions onwards)

Time: Three hours

Max.Weight:30

**Section –A**

(Answer any Eight questions. Each question carries a weight of 1)

1. What is the difference between optical and acoustic mode?
2. Define density of states.
3. Briefly discuss thermal conductivity of metals.
4. Define phonon momentum.
5. Define the axis vectors of a reciprocal lattice in terms of primitive cell lattice vectors.
6. What is a Brillouin zone? Give its construction.
7. Discuss about the different kinds of symmetry shown by crystals.
8. Discuss the phenomenon of antiferro magnetism.
9. How does adiabatic demagnetization produce cooling.
10. Obtain the expression for Lorentz number on the basis of quantum theory

**(1x8=8)**

**Section –B**

(Answer any SIX questions. Each question carries a weight of 2)

11. Calculate the glancing angle on the plane (110) of a cube rock salt ( $a=2.81\text{\AA}$ ) corresponding to second order diffraction maximum for the X-rays of wavelength  $0.71\text{\AA}$ .
12. Give three differences between dislocations in sc and fcc lattices. Compare both these with dislocations in the bcc lattice.

13. The thermal conductivity of aluminum at  $20^{\circ}\text{C}$  is  $210\text{Wm}^{-1}\text{K}^{-1}$ . Calculate the electrical resistivity of aluminum at this temperature. The Lorentz number of Aluminum is  $2.02 \times 10^{-8}\Omega\text{m}$ .
14. The Fermi energy of copper is  $7\text{eV}$ . Calculate (a) the Fermi momentum of electron in copper (b) the de Broglie wavelength of the electron and (c) the Fermi velocity.
15. Prove that in one dimensional diatomic lattice both acoustic and optical branches in dispersion curve meet the zone boundary normally.
16. Draw temperature dependence of susceptibility of all types of magnetic materials. Comment on them
17. A paramagnetic has  $10^{28}\text{atoms/m}^3$ . The magnetic moment of each atom is  $1.8 \times 10^{-23}\text{Am}^2$ . Calculate the paramagnetic susceptibility at  $300\text{K}$ . What would be the dipole moment of a bar of this material  $0.1\text{m}$  long and  $1\text{sq cm}$  cross-section placed in the field of  $8 \times 10^4\text{A/m}$ .
18. If in a one dimensional lattice,  $x = M/m \ll 1$ , prove that the square of the widths of the optical and acoustic branches are in the ratio  $x:4$

**(6x2=12)**

### **Section –C**

(Answer any two questions. Each question carries a weight of 5)

19. Explain the Ewald construction. Discuss how reciprocal lattice concept is useful in

X-ray diffraction studies.

20. Discuss Debye model of lattice heat capacity. Derive an expression for it.
21. Discuss Weiss theory of ferro magnetism. Mention its merits and demerits
22. Explain the vibrations of crystal with monoatomic basis. Obtain dispersion relation and discuss first Brillouin zone, long wave length limit and phase and group velocities.

**(2x5=10)**

MODEL QUESTION PAPER  
M.Sc. DEGRE (PGCSS0EXAMINATION  
THIRD SEMESTER  
FACULTY OF SCIENCE  
Branch II: Physics(A ) Pure Physics

**PH010301 – QUANTUM MECHANICS-II**

Time: 3 hours

Maximum Weight: 30

**PART A**

(Answer any **EIGHT** questions. Each question carries **1** weight)

1. Discuss the validity of the WKB method.
2. Give the Bohr-Sommerfeld quantization rule for a potential well.
3. Using WKB, method, obtain the tunneling probability in alpha decay.
4. What is meant by the interaction picture?
5. Give the expression for energy shift in time dependent perturbation.
6. Distinguish between bosons and fermions.
7. Write down the solution of the Klein-Gordon equation for a neutral spin 0 particle.
8. Express the Klein-Gordon equation in the Schrodinger form.
9. What is meant by *zitterbewegung*?
10. Explain how the stability of vacuum is assured in Dirac's theory.

**(8 X 1 = 8 )**

**PART B**

(Answer any **SIX** questions. Each question carries **2** weight )

11. A particle of charge  $q$  that undergoes a simple harmonic is subjected to a constant electric field along the  $x$ -direction. Find the first order correction in energy of the particle.
12. Using variational method, estimate the ground state energy of a particle moving under a delta function potential.

13. A particle, which is initially in the ground state of an infinite potential well with walls at  $x=0$  and  $x=L$ . It is subjected to a potential  $V(t) = V(0) e^{-t/\tau}$ . Calculate to first order the probability of transition from the ground state to the first excited state. The energies and energy eigenfunctions of the infinite potential well are given by  $E_n = \frac{n^2 \pi^2 \hbar^2}{2mL^2}$ ;  $\psi_n = \sqrt{\frac{2}{L}} \sin\left(\frac{n\pi x}{L}\right)$ ;  $n = 1, 2, 3 \dots$
14. Discuss electric dipole approximation.
15. Obtain the relation connecting differential cross section and scattering amplitude
16. Using the Born approximation, calculate the differential cross section for the scattering of an alpha particle of energy 8 MeV from a gold nucleus. Atomic number of helium=2; atomic number of gold=79. Scattering angle =  $60^\circ$ .
17. Obtain the continuity equation for the Klein-Gordon equation.
18. Prove the anti-commutation relations among Dirac matrices (alpha matrices and beta matrix).

(6 X 2 = 12 )

### PART C

(Answer any **TWO** questions. Each question carries 5 weight )

19. Develop the degenerate perturbation theory for stationary states and apply it to the first order Stark effect in hydrogen.
20. Derive the expression for total transition probability in case of constant perturbation and obtain Fermi's golden rule.
21. Discuss the partial wave analysis and apply it to the problem of hard sphere scattering.
22. Obtain the non-relativistic limit of the Dirac equation and hence deduce the spin of the Dirac particle.

(2 X 5= 10)

MODEL QUESTION PAPER  
M.Sc DEGREE (PGCSS) EXAMINATION  
Third Semester  
Faculty of Science  
Branch II : Physics (A) Pure Physics  
PH010302 - Computational Physics  
(2019 Admission onward)

Time : Three Hours

Maximum Weight 30

Part A

(Answer any Eight Questions. Each question carries 1 weight)

- 1) What do we understand by the term “First difference of a function  $y$ ” in case of interpolation? How do we represent it symbolically? Give one example also.
- 2) Define cubic spline function and explain its properties
- 3) A function  $y = f(x)$  is tabulated below. Calculate the slope of the function when  $x = 1.4$  using Newton's forward difference formula.

x	1.1	1.2	1.4	1.6	1.8	2	2.2
y	2.2783	3.33201	4.0552	4.9530	6.0496	7.3891	9.0250

- 4) Write down the equation we use to integrate a function using Simpson's 3/8 rule and explain each term used.
- 5) Using Euler method calculate the value of  $y$  at  $t=0.1$  in five steps. Given  $\frac{dN}{dt} = .5N$  with initial conditions  $N=10$  at  $t=0$ .
- 6) Solve the following system of equations,  $x+2y+3=0$ ,  $2x+y=3$  using Gauss-Jordan elimination method.
- 7) Find the inverse of a matrix  $A = \begin{bmatrix} 2 & 3 \\ 4 & 5 \end{bmatrix}$  using Gauss-Jordan method
- 8) Using power method calculate Eigen value and eign matrix of  $A = \begin{bmatrix} 2 & 3 & 3 \\ 3 & 3 & 2 \\ 3 & 2 & 3 \end{bmatrix}$
- 9) Write in short note on how do we obtain Schmidt two level explicit formula
- 10) Explain what is meant by Buffon's needle problem

(8X1=8)

Part B

(Answer any Six Questions. Each question carries 2 weight)

- 11) Water jet from an inclined hose is observed and the height of the water jet  $h$ , and horizontal distances  $x$  from the tip of the hose are tabulated as shown below. Assuming water follows a parabolic path, fit an appropriate curve and hence calculate the velocity with which water comes out.

x in meter	.1	.15	.2	.25	.3	.35	.4
h in meter	.075	.09375	.1	.09380	.0749	.04375	0

- 12) By using method of least squares, find the relation of the form  $y=ax^b$  to the data tabulated below:

x	2	3	4	5
y	27.8	62.1	110	161

13. The following data gives the melting point of an alloy of lead and zinc where T is the temperature in  $^{\circ}\text{C}$  and P is the percentage of lead in the alloy. Find the melting point of the alloy containing 75% of lead using Newton's interpolation method.

P	60	70	80	90
T	226	250	276	304

14. A river is 100meters wide. Depth, d, at various distances,x, from one bank of the river is tabulated as shown below. With the help of Simpson's 1/3 rule ,calculate the volume of water flowing through the river in one hour when velocity of water flow is 3m/s .

X in meter	0	10	20	30	40	50	60	70	80	90	100
d in meter	0	5	8	9	10	12	9	7	5	2	0

15. Use 4<sup>th</sup> order R-K method to solve  $\frac{dy^2}{dx^2} = x \frac{dy}{dx} + y^2$  Given  $y(0)=1$  , and  $\frac{dy}{dx}_{at x=0} = 2$   
Take  $h=0.2$  and find y and y' at  $x=0.2$

16. Find all eigen values and the corresponding eigen vectors of the matrix  $\begin{bmatrix} 1 & \sqrt{2} & 2 \\ \sqrt{2} & 3 & \sqrt{2} \\ 2 & \sqrt{2} & 1 \end{bmatrix}$

by Jacobi's method

17. Solve the equation  $y'=x^3+y$ , with initial condition  $y(0)=1$  to compute  $y(.02)$  using Euler's modified formula with  $h=0.01$ .  
18. Write a short note on using Monte Carlo method for evaluation of integrals.

(6X2=12)

#### Part C

(Answer any Two Questions. Each question carries 5 weight)

19. Starting from basics deduce Newton's Divided Difference interpolation formula.

20. Obtain the generalised trapezoidal rule of the form.

$\int f(x) = \frac{h}{2} y_0 + y_n + 2(y_1 + y_2 + y_3 + \dots + y_{n-1}) + E_n$  through geometrical approach. Write the expression for the error term  $E_n$ .

21. Explain why the concept of stability is important in selecting the step size while trying to solve differential equations numerically using Euler's method.

22. Use Crank-Nicholson method to find the numerical solution of the following parabolic partial differential equation after one time step;  $T_t = T_{xx}$ ; with  $0 < x < 1$ ; subjected to the initial condition  $T(x, 0) = 1$ , with  $0 < x < 1$  and boundary condition  $T(0, t) = T(1, t) = 0$  with  $t \geq 0$ . Compute the solution by taking  $\Delta t = 1/32$ .

(2X5=12)

MODEL QUESTION PAPER  
M.Sc. DEGREE (PGCSS) EXAMINATION  
THIRD SEMESTER  
FACULTY OF SCIENCE  
Branch II: Physics(A) Pure Physics

**PH010303 – ATOMIC AND MOLECULAR PHYSICS**

Time: 3 hours

Maximum Weight: 30

**PART A**

(Answer any **EIGHT** questions. Each question carries **1** weight)

1. What is Paschen-Back effect?
2. Explain hyperfine structure in atomic spectral lines?
3. What is the information derivable from the rotational spectrum of a molecule?
4. Explain what is meant by Morse potential.
5. Differentiate between skeletal vibrations and group frequencies.
6. How does the polarizability of a molecule influence its Raman activity?
7. Explain stimulated Raman effect.
8. Distinguish between progressions and sequences.
9. What is meant by chemical shift in NMR spectrum?
10. Explain Fermi contact interaction.

(8 X 1 = 8)

**PART B**

(Answer any **SIX** questions. Each question carries **2** weight)

11. The term symbol for an atomic state is  $^2P_{3/2}$ . What are the values of  $L$ ,  $S$  and  $J$  for this state? Calculate the Lande's g-factor for this state. What type of Zeeman effect this atom will give?
12. Derive all possible terms arising out of the combination of an s-electron with a p-electron in LS coupling scheme. Also calculate the separation between singlet state and triplet states.
13. Explain collision broadening and Doppler broadening

14. The rotational constant of  $^1H^{35}Cl$  is observed to be  $10.5909\text{cm}^{-1}$ . Determine the value of B for  $^1H^{37}Cl$  and  $^2D^{35}Cl$ .

15. When  $H_2$  molecule is irradiated with 435.8nm line, the Raman Stoke's vibrational line appear at  $18551.05\text{ cm}^{-1}$ . Find the wavenumber of the ant-Stoke's line, the force constant and zero point energy. Atomic weight of hydrogen= 1.008. Avagadro number is  $6.023 \times 10^{23}$ . Obtain the relation connecting differential cross section and scattering amplitude

16. The band origin of a transition in a molecule is observed at  $19,378\text{ cm}^{-1}$ . The rotational fine structure indicates that the rotational constants in excited and ground states are  $17527\text{ cm}^{-1}$  and  $16326\text{ cm}^{-1}$  respectively. Estimate the position of the band head. Which state has larger internuclear distance?

17. Electron spin resonance is observed for atomic hydrogen with an instrument operating at 9.5 GHz. If the g value for the electron in the hydrogen atom is 2.0026, what is the magnetic field applied?

18. Calculate the recoil velocity of a free Mossbauer nucleus of mass  $1.67 \times 10^{-25}\text{ kg}$ , when emitting a gamma ray of wavelength 0.1 nm. What is the Doppler shift of the gamma ray to an outside observer?

(6 X 2 = 12)

### PART C

(Answer any **TWO** questions. Each question carries 5 weight)

19. Discuss the fine structure of one electron atoms and derive an expression for the fine structure splitting in hydrogen like atoms.

20. Describe the spectrum of a diatomic vibrating rotator assuming Born-Oppenheimer approximation. Discuss the changes in the spectrum when this approximation breaks down

21. Describe how the molecular structure is determined using Raman and IR spectroscopies.

22. Explain the relaxation processes in nuclei and obtain the Bloch equations for the components of nuclear magnetization.

(2 X 5= 10)

**M Sc (Physics) Degree (C.S.S) Examination,**

**Fourth Semester**

Faculty of Science

Course Code- **PH010401 NUCLEAR AND PARTICLE PHYSICS**

(2025 admissions onwards)

Time: Three hours

Max. Weight: 30

**Section- A**

(Answer any **eight** questions. Each question carries a weight of 1)

1. Compare nuclear scattering with optical diffraction.
2. What is meant by isotopic shift? How it is useful in isotope separation.
3. Explain the term electric quadrupole moment.
4. How can you explain the continuous spectrum of  $\beta$  decay?
5. Differentiate between direct reaction and compound nucleus reactions.
6. What is meant by reaction cross section?
7. Why a proton cannot decay except at GUT energies?
8. Explain the role of Higg's mechanism in symmetry breaking of electro-weak interaction
9. Explain 'r process' and 's process'
10. What are the advantages of carbon dating using accelerator mass spectroscopy technique?

**( 8 x 1 = 8 )**

**Section B**

(Answer any **six** questions. Each question carries a weight of 2)

11. Briefly explain the nuclear force as an exchange force mediated by mesons.
12. Explain the properties of deuteron
13. Explain forbidden  $\beta$  decay
14. A free neutron decays into a proton by the emission of  $\beta^-$  particles of maximum kinetic energy 0.782MeV. If the rest mass of the electron and neutron are 0.0005486u and 1.008665u respectively, find the mass of proton. (1u=931.478MeV)

15. A tritium gas target is bombarded with a beam of monoenergetic protons of kinetic energy 3 MeV to produce  $\text{He}^3$  and neutron. What is the kinetic energy of the neutrons emitted at  $30^\circ$  to the incident beam? ( $H^1=1.007276\text{u}$ ,  $n^1=1.008665\text{u}$ ,  $H^3=3.016056\text{u}$  and  $\text{He}^3=3.016030\text{u}$ )
16. Detail the classification of elementary particles.
17. With the help of conservation laws, determine which of the following reactions are allowed through strong interactions. If they are forbidden, explain why?

a)  $p + p \rightarrow K^+ + \Sigma^+$

b)  $\pi^- + p \rightarrow n + \gamma$

c)  $p \rightarrow e^+ + \gamma$

d)  $K^0 \rightarrow \pi^- + \pi^+$

18. What is meant by positron emission tomography. How it can be used in brain scans?

(6 x 2 = 12)

### Section C

(Answer any **two** questions. Each question carries a weight of 5.)

19. Describe shell model in nuclear physics. How is it successful in explaining parity, magnetic dipole moment and quadrupole moment?
20. Explain coulomb scattering and derive differential cross section for elastic coulomb scattering.
21. Explain Quark model. What are the experimental evidences supporting quark model. What is meant by colored quarks and what is its significance?
22. Describe primordial nucleosynthesis

(2 x 5 = 10)

# M Sc PHYSICS Degree (C.S.S) Examination

III Semester

Faculty of Science

## PH800301 DIGITAL SIGNAL PROCESSING

(2025 admissions onwards)

Time: Three hours

Max. Weight: 30

### Section- A

(Answer any **eight** questions. Each question carries a weight of 1)

1. What you mean by signals? List the classifications of signals.
2. What are FIR and IIR systems?
3. Explain convolution sum.
4. Distinguish between DFT and DTFT.
5. What is decimation in Time? Explain.
6. Define Z-Transform.
7. What is meant by poles and zeros of the system function ?
8. Differentiate between FIR and IIR filter.
9. Obtain window technique.
10. what is direct form I structure of IIR system?

( 8 x 1 = 8 )

### Section B

(Answer any **six** questions. Each question carries a weight of 2)

11. Describe the advantage limitations and applications of DSP.
12. Explain with examples the different types of operations on signals.
13. Calculate the DFT of the sequence  $x(n)=\{1,1,0,0\}$
14. Explain the computational merits of FFT.
15. Find the Z transform and ROC of the causal sequence  $x(n)=\{1,0,3,-1,2\}$
16. Explain the zeros and poles of system function. Explain the stability criterion related to system function
17. Explain the design of IIR filter using impulse invariance technique
18. Explain the Direct form II realization of digital filters

**6 x 2 = 12)**

### Section C

(Answer any **two** questions. Each question carries a weight of 5.)

19. Describe the Classification of discrete time signals with examples.
20. Prove any six properties of DFT
21. Define the Z-transform. What is ROC? What are the properties of ROC?
22. Describe the different methods of realization of digital filters

(2 x 5 = 10)

## **M.Sc PHYSICS Degree (C.S.S) EXAMINATION**

### **Fourth Semester**

### **Faculty of Science**

### **PH800402- MICROELECTRONICS AND SEMICONDUCTOR DEVICES**

**(2025 admission onwards)**

Time: 3hrs

Maximum Weight: 30

#### **Part A**

*Answer any **four** questions.*

*Each question carries 2 weights.*

1. How many clock cycles will be required by 8086 to access a 16 bit word located at an even address?
2. Explain the frequency measurement using microcontroller system.
3. What is two dimensional electron gas? Explain.
4. Write the characteristics of heterojunction materials.
5. Write a note on Cache memory.
6. What are the features of 8051 microcontroller?
7. Obtain the IC technology for resistor formation

(4 x 2 = 8)

#### **Part B**

*Answer any **four** questions.*

*Each question carries 3 weights.*

8. Explain the various addressing modes in 8086 processor.
9. Draw and explain the memory structure of 8085 processor.
10. A uniformly doped n-type silicon epitaxial layer of  $0.5\Omega\text{-cm}$  resistivity is subjected to boron diffusion with constant surface concentration of  $5 \times 10^{18}$

- $\text{cm}^{-3}$ . It is desired to form a p-n junction at a depth of  $2.7\mu\text{m}$ . At what temperature should this diffusion be carried out if it is to be completed in 2hr?
11. Write a programme to sort an array of 6 numbers in ascending order using 8086.
  12. How can an I/O pin can be both an input and output in 8051 microcontroller?
  13. Consider n-type *Ge* doped with  $N_d = 10^{16} \text{ cm}^{-3}$  and P-type *GaAs* doped with  $N_a = 10^{16} \text{ cm}^{-3}$ . Let  $n_i = 2.4 \times 10^{13} \text{ cm}^{-3}$  for *Ge* at  $T = 300 \text{ K}$ . Determine the difference between two conduction band energies ( $\Delta E_c$ ), difference between two valence band energies ( $\Delta E_v$ ) and the total built in potential barrier  $V_{bi}$  for an *n-Ge* to *p-GaAs* heterojunction using the electron affinity rule.
  14. Consider a contact between tungsten and n-type silicon doped to  $N_d = 10^{16} \text{ cm}^{-3}$  at  $T = 300 \text{ K}$ . Calculate the theoretical barrier height, built in potential barrier and a maximum electric field in a metal semiconductor diode for zero applied bias. Given, the metal work function for tungsten =  $4.55 \text{ V}$  and the electron affinity for silicon is  $4.01 \text{ V}$ .

(4 x 3 = 12)

### Part C

Answer any **two** questions.

Each question carries 5 weights.

15. Draw and explain the timing diagram for memory read operation of 8085 processor
16. Draw the 8086 internal architecture and explain.
17. Discuss the instruction set of 8051 microcontroller with appropriate example.
18. Discuss in detail the fabrication of an integrated circuit.

(2 x 5 = 10)

## M Sc (Physics). Degree (C.S.S) Examination

Fourth Semester

Faculty of Science

Course Code- PH800403-COMMUNICATION SYSTEMS

(2025 admissions onwards)

Time: Three hours

Max. Weight: 30

### Section- A

(Answer any **eight** questions. Each question carries a weight of 1)

1. Explain VSAT
2. What is CW Doppler radar
3. Explain GSM
4. State its merits and demerits of PAM
5. Explain the significance of Doppler frequency in RADAR communication
6. Explain total internal reflection
7. What do you mean by guard channel concept?
8. Explain the acceptance angle and numerical aperture for optic fiber.
9. Write a short note on GPS
10. Explain noise in digital data communication.

( 8 x 1 = 8 )

### Section B

(Answer any **six** questions. Each question carries a weight of 2)

11. If a signal to interface ratio of 15 KB is required for satisfactory forward channel performance of a cellular system ,What is the frequency use factor and cluster size that should be used for maximum capacity if the path loss exponent is (a)  $n=4$  (b)  $n=3$  ? There are six co-channels in the first tier and all of them are at same distance from the mobile.
12. A silica optical fiber with a core diameter large enough to be considered by ray theory analysis has a core refractive index of 1.50 and a cladding refractive index of 1.47. Determine: (a) the critical angle at the core–cladding interface; (b) the NA for the fiber; (c) the acceptance angle in air for the fiber.

13. Explain the dispersion in fiber optic communication.
14. What are multiplexing techniques? Discuss in detail TDM and FDM.
15. How to improve coverage and capacity of a cellular system?
16. How to improve coverage and capacity of a cellular system?
17. Explain MTI radar.
18. Discuss about digital transmission techniques.

(6 x 2 = 12)

### Section C

(Answer any **two** questions. Each question carries a weight of 5.)

19. Explain PCM. What do you mean by quantizing noise? Explain the generation and demodulation of PCM
20. Explain step index and graded index fibers with index profile diagram.
21. What are the multiple access techniques for wireless communication?
22. Derive radar range equation and discuss various target properties.

(2 x 5 = 10)

**MSc PHYSICS DEGREE EXAMINATION**  
**III SEMESTER**  
**Faculty of Science**

**PH810301 SOLID STATE PHYSICS FOR MATERIALS**

**(2025 admissions onwards)**

Time: 3 hours

Max. Weight: 30

Part A: (Answer any **eight** questions. Each question carries a weight of 1)

1. What is polytypism?
2. How do Van der Waals- London interaction evolve?
3. Distinguish between Frenkel and Wannier excitons?
4. Explain edge dislocation.
5. Discuss the formation of stacking faults in fcc crystals.
6. What is Kirkendall effect?

7. Write a note on plasmons.
8. Explain the role of polarons in crystals.
9. What is polymorphism?
10. State Puling's rules.

(8x1=8)

Part B:( Answer any **six** questions. Each question carries a weight of 2)

11. Determine the fraction of atoms in a given solid with energy equal to or greater than 1.4eV at room temperature and 5 times room temperature.
12. Find the radius of the largest sphere that will fit into the void produced by the bcc packing of atoms of radius R.
13. Explain the importance of Born-Haber cycle.
14. Briefly discuss the phase diagram rules.
15. Discuss the role of phase diagram in zone refining of materials.
16. What is LST relation? Explain its importance.
17. What are the different types of diffusion mechanisms? Explain.
18. Assume that the potential energy of two particles in the field of each other is given by  $U = -\frac{A}{R} + \frac{B}{R^9}$  Show that where A and B are constants.

particles form a stable compound for  $R = \left( \frac{9B}{A} \right)^{1/8}$ . prove that for stable

configuration, the energy of attraction is 9 times the energy of repulsion. Also find the potential energy under stable configuration.

(6x2=12)

Part C:( Answer any **two** questions. Each question carries a weight of 5)

19. Explain Madelung energy and evaluate the Madelung constant for a one dimensional chain.
20. Discuss the origin of the quantization of spin waves.
21. What is dislocation and obtain the expression for the energy of dislocation.
22. What are Fick's laws? Obtain the solution for second Fick's law for the diffusion through a plane surface.

(2x5=10)

MSc PHYSICS DEGREE EXAMINATION

IV SEMESTER  
Faculty of Science

**PH810402 Science of Advanced Materials**  
**(2025 admissions onwards)**

Time: 3 hours

Max. Weight:30

Part A:( Answer any *eight* questions. Each question carries a weight of 1)

1. What are refractories? List their features.
2. What are semimetals?
3. What do you mean by dielectric breakdown?
4. Mention the properties of Gaussian beams.
5. Distinguish between temporal and spatial coherence.
6. List the features of photonic crystals.
7. Compare SLED and ELED.
8. What is nucleation?
9. What the natures of thin films?
10. Write a note on cathodic sputtering.

(8x1=8)

Part B:( Answer any *six* questions. Each question carries a weight of 2)

11. Compare thermoplastic and thermosetting polymers.
12. The tensile strength of 2 PMMA materials are 50MPa and 150MPa. Their respective number average molecular weight in g/mol are 30,000 and 50,000. Estimate the tensile strength at a number average molecular weight of 40,000 g/mol.
13. Show that the photovoltage varies logarithmically with photocurrent.
14. Find the ratio of populations of the two states in a laser that produces a wavelength of 590nm at room temperature.
15. An acousto-optic cell of Raman Nath modulator contains water. A piezoelectric crystal generates an acoustic wave of frequency 5MHz in water. The velocity of the acoustic wave in water is 1500m/s and the thickness of the cell is 1cm. If a laser beam of 632nm is incident on the cell, calculate the angle between the first order diffracted beam and the direct beam.

16. Discuss the classification of liquid crystals.
17. Differentiate between type I and type II superconductors.
18. Explain Josephson tunnelling. (6x2=12)

Part C:( Answer any **two** questions. Each question carries a weight of 5)

19. Discuss the mechanical properties of ceramics.
  20. How does mode locking be different from Q-switching? How are they achieved?
  21. Explain the solar cell principles and characteristics.
  22. Analyse the electrodynamics of superconductors.
- (2x5=10)

MSc PHYSICS DEGREE EXAMINATION  
IV SEMESTER

Faculty of Science

**PH810403 Nanostructures and Materials Characterisation**  
**(2025 admissions onwards)**

Time: 3 hours

Max. Weight:30

Part A: ( Answer any **eight** questions. Each question carries a weight of 1)

1. Write a note on quantum dots.
2. What are super lattices?
3. Explain self-assembly.
4. What are the advantages of nanosensors?
5. Why does graphene be important in nanoworld?
6. Distinguish between bathochromic and hypsochromic shifts.
7. What are the features of thermal lens spectroscopy?
8. State and explain Moseley's law.
9. Define amu and daltons.
10. Why are the applications of TGA more limited than those for DSC?

(8x1=8)

Part B:( Answer any **six** questions. Each question carries a weight of 2)

11. Discuss the various steps involve d in a CVD process.
12. Briefly explain the nanolithographic techniques.
13. Describe the features of giant and colossal magnetoresistance.
14. Discuss the size effects in nanostructures.

15. If the molar absorptivity of a complex is  $12000 \text{ l mol}^{-1} \text{ cm}^{-1}$  and the minimum detectable absorbance is 0.001, find the minimum molar concentration that can be detected for 1cm path length.
16. What are the advantages of Fourier transform spectrometry?
17. What is the short wavelength limit of the continuum produced by an X-ray tube having silver target and operated at 90kV?
18. An AFM cantilever has a spring constant 0.1N/m. Find its mass if oscillating frequency is 40kHz.

(6x2=12)

Part C: ( Answer any **two** questions. Each question carries a weight of 5)

19. Discuss the theory of quantum leak.
20. Explain the properties and applications of nano ZnO and TiO<sub>2</sub>.
21. (a) Explain how the photoluminescence power is related to concentration. (b) How does the fluorescence lifetime be calculated?
22. Analyse the functioning of TEM and how can you use TEM for quantitative analysis.

(2x5=10)
